<tr>
<td>Jul. 19, 2018</td>
<td>1.12</td>
<td>Updated timing requirement of several fast role swap tests according to the consensus at this week’s compliance meeting</td>
</tr>
</tbody>
</table>
• Updated response for invalid Get_Manufacture_Info: SRC3.E20...E21, SNK3.E17...E18, CBL3.E3  
• Updated SRC3.14 and SNK3.15: allowing Data Size of 5 or 6; checking reserved bits in Power Status |
| Mar. 26, 2019 | 1.14     | • Updated VDM3.E1 Active Cable VDO 1: VDO Version = Version 1.2 (010b), do not check Bits 2...0 (Reserved) due to pending ECR.  
• Updated SRC3.E14, SNK3.E15: Status message Data Size = 6 (not 5)  
• Updated VNDI3.E12: use FR_Swap_Reqd_Type_C_Current_As_Initial_Source  
• Updated FRSISNK3.E1: removed the requirement of iSnkSwapStdby  
• Updated FRSISRC3.E1, VNDI3.E8: FR_Swap_Reqd_Type_C_Current (old name) -> FR_Swap_Reqd_Type_C_Current_As_Initial_Source (new name)  
• Updated FRSISNK3.E1: FR_Swap_Supported_As_Source (old name) -> FR_Swap_Supported_As_Initial_Sink (new name)  
• Updated VNDI3.E12: FR_Swap_Supported_As_Source (old name) -> FR_Swap_Reqd_Type_C_Current_As_Initial_Source |
Terms and Abbreviations

The terms and abbreviations specific to compliance testing are listed in the table below. All other used terms and abbreviations are from the relevant specifications.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tester</td>
<td>The Tester is a piece of test equipment capable of running all tests described in this specification against an UUT.</td>
</tr>
<tr>
<td>Unit Under Test (UUT)</td>
<td>The PD device that is being tested by the Tester.</td>
</tr>
</tbody>
</table>
Test Results

The result of a test may be one of the following:

- **Pass**
  - The UUT meets all assertions tested in the test
- **Fail**
  - The UUT doesn’t meet at least one assertion tested in the test
- **Not Applicable (N/A)**
  - The test is not applicable to the UUT because one of the following reasons
    - The test is not applicable to this UUT Type
    - The UUT doesn’t meet a prerequisite

Test Procedures

PROC.PD.E1. Bring-up procedure

For UFP(Sink) UUT:

a) The test starts in a disconnected state.
b) The Tester applies Rp (1.5 A) and waits for the UUT attachment.
c) If Ra is detected, the Tester applies Vconn.
d) The Tester applies Vbus and waits 50 ms.
e) The Tester transmits Source_Capabilities until reception of GoodCrc for tNoResponse max. The Source_Capabilities includes Fixed 5V 3A PDO.
f) The Tester waits for the Request from the UUT for tsenderResponse max. If the Specification Revision field of the Request message is 01b (Rev 2.0), the test is not applicable and stops here.
g) The Tester sends Accept, and when Vbus is stable at the target voltage, sends PS_RDY.

For DFP(Source) UUT:

a) The test starts in a disconnected state.
b) The Tester applies Rd and waits for Vbus for tNoResponse max.
c) The Tester waits for Source_Capabilities for tNoResponse max. If the Specification Revision field of the Source_Capabilities message is 01b (Rev 2.0), the test is not applicable and stops here.
d) The Tester replies GoodCrc on reception of the Source_Capabilities.
e) The Tester requests 5V 0.5A.
f) The Tester waits for PS_RDY for tpSSourceOn max.

For Cable UUT:

a) The test starts in a disconnected state.
b) The Tester applies Rp (3A) and waits for the UUT attachment (Ra Detected).
c) The Tester applies Rp (3A) and Rd on CC.
d) The Tester applies Vconn.
e) The Tester sends a Discover Identity message to the UUT.
f) If the Specification Revision field of the message received is 01b (Rev 2.0), the test is not applicable and stops here.

Note:

1. Cable tests need to be run four times:
   a. At both ends of the cable
   b. At two VConn voltage levels: 2.75V and 5.75V
2. The Tester uses SOP’ message in cable tests
For DRP UUT:
   a) If a test applies to Source or Provider/Consumer, test the UUT as a Source.
   b) If a test applies to Sink or Consumer/Provider, test the UUT as a Sink.

PROC.PD.E2. Bring-up procedure for PPS Tests

For UFP(Sink) UUT:
   a) The test starts in a disconnected state.
   b) The Tester applies Rp (1.5 A) and waits for the UUT attachment.
   c) If Ra is detected, the Tester applies Vconn.
   d) The Tester applies Vbus and waits 50 ms.
   e) The Tester transmits Source Capabilities until reception of GoodCrc for tNoResponse max. The Source Capabilities includes Fixed 5V 3A PDO and PPS 5V 3A APDO.
   f) The Tester waits for the Request from the UUT for tSenderResponse max.
   g) Upon receipt of the Request message from the UUT, The Tester sends Accept, and when Vbus is stable at the target voltage, sends PS_RDY. If the Sink requests the PPS APDO, the bring-up procedure ends up here,
   h) The Tester change the Rp value to SinkTXOK.
   i) If the Sink doesn’t request the PPS APDO in 5s from the time the Rp value changed to SinkTXOK, the test is not applicable. If the Request message is received, The Tester sends Accept, and when Vbus is stable at the target voltage, sends PS_RDY.

For DFP(Source) UUT:
   a) The test starts in a disconnected state.
   b) The Tester applies Rd and waits for Vbus for tNoResponse max.
   c) The Tester waits for Source Capabilities for tNoResponse max.
   d) The Tester replies GoodCrc on reception of the Source Capabilities.
   e) If there is no PPS APDO in the Source Capabilities, the test is not applicable and stops here.
   f) The Tester requests PPS APDO at 4V 1A.
   g) The Tester waits for PS_RDY for tPSSourceOn max.

For DRP UUT:
   a) If a test applies to Source or Provider/Consumer, test the UUT as a Source.
   b) If a test applies to Sink or Consumer/Provider, test the UUT as a Sink.
PROC.PD.E3. Wait to Start AMS

For DFP(Source) UUT:

a) The Tester keeps monitoring the Rp value and if the UUT doesn’t set the value to SinkTXOK if it doesn’t have anything to send in 1s, the test fails. During this period, the Tester replies any message sent from the UUT with a proper response.

PROC.PD.E4. Bring-up procedure for Fast Role Swap tests

For initial Source:

a) The test starts in a disconnected state.
b) The Tester applies Rd. If the UUT does not apply VBUS and send the Source_Capabilities message within tNoResponse max, the test fails. If the Specification Revision field of the Source_Capabilities message is 01b (Rev 2.0), the test is not applicable and stops here.
c) The Tester replies GoodCrc on reception of the Source_Capabilities
d) The Tester requests for a contract at vSafe5V
e) The Tester waits for PS_RDY for tPSSourceOn max
f) The Tester waits until it can start an AMS and then send the Get_Sink_Cap message

Note that the UUT needs to maintain the intended operation throughout the Fast Role Swap test. For example:

- The UUT has more than one Type-C connector, another Type-C port (not used for the FR Swap initial Source testing) shall be connected to a separate Sink.
- The implicit contract on this separate Type-C port (not used for FR Swap initial Source testing) shall be at FR_Swap_Reqd_Type_C_Current_As_Initial_Source parameter (as specified in the VIF) and the current drawn on this Type-C port shall be up to 80% of the value of FR_Swap_Reqd_Type_C_Current_As_Initial_Source.
- The VBUS of one of the Source port (or DFP) of the UUT remain within the range of vSafe5V throughout the test.

For initial Sink:

a) The test starts in a disconnected state.
b) The Tester applies Rp (1.5 A), and it waits for the UUT attachment.
c) If Ra is detected, the Tester applies Vconn.
d) The Tester applies Vbus and waits for 50 ms.
e) The Tester transmits Source_Capabilities message until reception of GoodCrc or until tNoResponse max has elapsed. The Source_Capabilities message includes Fixed Supply PDO 5V at 3A.
f) The Tester waits for the Request message from the UUT for tSenderResponse max.
g) The Tester sends Accept message. When Vbus is stable at the target voltage, the Tester sends PS_RDY message.
h) The Tester sends Get_Source_Cap message and read the UUT’s SourceCapabilities message.
i) The Tester presents SinkTxOK.
j) The Tester waits for 500ms for the UUT to send `Get_Sink_Cap` message and then the Tester replies with `Sink_Capabilities` message. The `Fast Role Swap USB Type-C Current` field (in the `Sink_Capabilities` message from the Tester) uses the value in the UUT’s `Source_Capabilities` message PDO 5V (as obtained in step h), rounded down to the highest of 3A, 1.5A or default. Otherwise, the test is not applicable, and it stops here.
### New or changed assertions in PD3

<table>
<thead>
<tr>
<th>Assertion No.</th>
<th>Covered</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.4#1</td>
<td>y</td>
<td>The Source Shall limit maximum capabilities it offers so as not to exceed the capabilities of the type of cabling detected.</td>
</tr>
<tr>
<td>4.4#2</td>
<td>y</td>
<td>Sources Shall detect the type of Attached cable and limit the Capabilities they offer based on the current carrying capability of the cable determined by the Cable capabilities determined using the Discover Identity Command (see Section 6.4.4.2) sent using SOP’ Communication (see Section 2.5) to the Cable Plug.</td>
</tr>
<tr>
<td>4.4#5</td>
<td>y</td>
<td>Sources Shall run the cable detection process prior to the Source sending Source_Capabilities Messages offering currents in excess of 3A and/or voltages in excess of 20V.</td>
</tr>
<tr>
<td>5.4#2</td>
<td></td>
<td>The receiver Shall search for all four K-codes and when it finds either three out of four or all four in the correct place, it May interpret it as a Valid ordered set (see Table 5-3).</td>
</tr>
<tr>
<td>5.7#6</td>
<td>y</td>
<td>In addition the PHY Layer Shall control the Rp resistor value to avoid collisions between Source and Sink transmissions.</td>
</tr>
<tr>
<td>5.7#7</td>
<td>y</td>
<td>The Source Shall set an Rp value corresponding to a current of 3A to indicate to the Sink that it May initiate an AMS.</td>
</tr>
<tr>
<td>5.7#8</td>
<td>y</td>
<td>The Source Shall set an Rp value corresponding to a current of 1.5A this Shall indicate to the Sink that it Shall Not initiate an AMS and Shall only respond to Messages as part of an AMS.</td>
</tr>
<tr>
<td>5.7#9</td>
<td>y</td>
<td>Table 5-13 details the Rp values that Shall be used by the Source to control Sink initiation of an AMS.</td>
</tr>
<tr>
<td>5.8.5.5#1</td>
<td></td>
<td>A Transmitter in a Port or Cable Plug Shall tolerate having its output be shorted to ground for tFRSwapTx max.</td>
</tr>
<tr>
<td>5.8.5.6#1</td>
<td>y</td>
<td>The initial Source Shall signal a Fast Role Swap request by driving CC to ground with a resistance of less than rFRSwapTx for tFRSwapTx.</td>
</tr>
<tr>
<td>5.8.5.6#2</td>
<td></td>
<td>The initial Source Shall only signal a Fast Role Swap when it has an Explicit Contract.</td>
</tr>
<tr>
<td>5.8.5.6#3</td>
<td></td>
<td>On transmission of the Fast Role Swap signal any pending Messages Shall be Discarded (see Section 6.11.2.2.1).</td>
</tr>
<tr>
<td>5.8.5.6#4</td>
<td>y</td>
<td>Since the initial Sink’s response to the Fast Role Swap signal is to send an FR_Swap Message, the initial Source Shall ensure Rp is set to SinkTxOk once the Fast Role Swap signal is complete.</td>
</tr>
<tr>
<td>5.8.6.3#1</td>
<td></td>
<td>The initial Sink Shall only respond to the Fast Role Swap signal when it has an Explicit Contract.</td>
</tr>
<tr>
<td>5.8.6.3#2</td>
<td>On detection of the Fast Role Swap signal any pending Messages Shall be Discarded (see Section 6.11.2.2.1).</td>
<td></td>
</tr>
<tr>
<td>5.8.6.3#3</td>
<td>Therefore, when the initial Sink is prepared for a Fast Role Swap, it Shall Not detect a Fast Swap signal when the CC voltage, averaged over tFRSwapRx min, is above 0.7V.</td>
<td></td>
</tr>
<tr>
<td>5.8.6.3#4</td>
<td>When the initial Sink is prepared for a Fast Role Swap, it Shall detect a CC voltage lower than vFRSwapCableTx min for tFRSwapRx as a Fast Role Swap request.</td>
<td></td>
</tr>
<tr>
<td>5.8.6.3#5</td>
<td>The initial Sink Shall initiate the Fast Role Swap AMS within tFRSwapInit of detecting the Fast Role Swap request in order to assign the Rp/Rd resistors to the correct Ports and to re-synchronize the state machines (see Section 6.3.17).</td>
<td></td>
</tr>
<tr>
<td>5.8.6.3#6</td>
<td>The initial Sink Shall become the new Source and Shall start supplying vSafe5V at USB Type-C Current (see [USB Type-C 1.2]) no later than tSrcFRSwap after VBUS has dropped below vSafe5V.</td>
<td></td>
</tr>
<tr>
<td>5.8.6.3#7</td>
<td>An initial Sink Shall disable its VBUS Disconnect Threshold detection circuitry while Fast Role Swap detection is active.</td>
<td></td>
</tr>

### 6.4.2.6#1
- **y**  
  The Unchunked Extended Messages Supported bit Shall be set when the Port can send and receive Extended Messages with Data Size > MaxExtendedMsgLegacyLen bytes in a single, Unchunked Message.

### 6.4.2.7#3
- **SPT**  
  When the request is accepted the Source’s output current supplied into any load Shall be less than or equal to the Operating Current.

### 6.4.2.7#4
- **SPT**  
  When the Sink attempts to consume more current, the Source Shall reduce the output voltage so as not to exceed the Operating Current value.

### 6.4.2.7#6
- **Y**  
  This field Shall apply to the Fixed, Variable and Programmable RDO.

### 6.4.2.13#1
- **y**  
  The Output Voltage field in the Programmable Request Data Object Shall be set by the Sink to the voltage the Sink requires as measured at the Source’s output connector.

### 6.4.2.13#2
- **y**  
  The Output Voltage field Shall be greater than or equal to the Minimum Voltage field and less than or equal to the Maximum Voltage field in the Programmable Power Supply APDO.

### 6.4.2.13#3
- **Y**  
  This field Shall apply to the Programmable RDO.

### 6.4.4.1#9
- **y**  
  When a DFP or UFP does not support Unstructured VDMs or does not recognize the VID it Shall return a Not_Supported Message.

### 6.4.4.2#6
- **y**  
  When a DFP or UFP does not support Structured VDMs any Structured VDMs received Shall return a Not_Supported Message.

### 6.4.4.2#10
- **y**  
  Version 1.0 = 00b (Shall Not be used)

### 6.4.4.2.3#2
- **y**  
  To ensure interoperability with existing USBPD Products, USBPD Products Shall support every Structured VDM Version number starting from Version 1.0.

### 6.4.4.3.1.1.3#1
- **y**  
  For DRD Products this field Shall indicate the capability regardless of the present Data Role.

### 6.4.4.3.1.1.6#1
- **y**  
  For DRD Products this field Shall indicate the capability regardless of the present Data Role.

### 6.4.4.3.1.1.6#2
- **y**  
  Table 6-32 defines the Product Type VDOs which Shall be returned.

### 6.4.4.3.1.1.6#3
- **y**  
  Shall be used where no other Product Type value is appropriate.

### 6.4.4.3.1.1.6#4
- **y**  
  Shall be used when the Product is a PDUSB Hub.

### 6.4.4.3.1.1.6#5
- **y**  
  Shall be used when the Product is a PDUSB Host.

### 6.4.4.3.1.1.6#6
- **y**  
  Shall be used when the Product is a Power Brick/Wall Wart.

### 6.4.4.3.1.1.6#7
- **y**  
  Shall be used when the Product is a PDUSB Host or DFP that supports one or more Alternate Modes.

<tr>
<td>6.5.1.3#1</td>
<td>The XID field Shall contain the 32-bit XID provided by the USB-IF to the vendor who in turns assigns it to a product.</td>
</tr>
<tr>
<td>6.5.1.3#2</td>
<td>If the vendor does not have an XID, then it Shall return zero in this field (see [USB 2.0] and [USB 3.1]).</td>
</tr>
<tr>
<td>6.5.1.4#1</td>
<td>The Firmware Version field Shall contain an 8-bit firmware version number assigned to the device by the vendor.</td>
</tr>
<tr>
<td>6.5.1.5#1</td>
<td>The Hardware Version field Shall contain an 8-bit hardware version number assigned to the device by the vendor.</td>
</tr>
<tr>
<td>6.5.1.6.1#1</td>
<td>The Source Shall report its load step response capability in bits 0…1 of the Voltage Regulation bit field.</td>
</tr>
<tr>
<td>6.5.1.6.2#1</td>
<td>The Source Shall report its load step magnitude rate as a percentage of IoC in bit 2 of the Voltage Regulation field.</td>
</tr>
<tr>
<td>6.5.1.7#1</td>
<td>The Holdup Time field Shall contain the Source’s holdup time (see Section 7.1.12.2).</td>
</tr>
<tr>
<td>6.5.1.8#1</td>
<td>The Compliance field Shall contain the standards the Source is compliant with (see Section 7.1.12.3).</td>
</tr>
<tr>
<td>6.5.1.9#1</td>
<td>A Source Shall set the Touch Current bit (bit-0) when their leakage current is less than 65µA rms when Source’s maximum capability is less than or equal to 30W, or when their leakage current is less than 100 µA rms when its power capability is between 30W and 100W.</td>
</tr>
<tr>
<td>6.5.1.9#2</td>
<td>The total combined leakage current Shall be measured in accordance with [IEC 60950-1] when tested at 250VAC rms at 50 Hz.</td>
</tr>
<tr>
<td>6.5.1.9#3</td>
<td>A Source with a ground pin Shall set the Ground pin bit (bit-1).</td>
</tr>
<tr>
<td>6.5.1.9#4</td>
<td>A Source whose Ground pin is intended to be connected to a protective earth Shall set both bit1 and bit 2.</td>
</tr>
<tr>
<td>6.5.1.10#1</td>
<td>The Peak Current field Shall contain the combinations of Peak Current that the Source supports (see Section 7.1.12.4).</td>
</tr>
<tr>
<td>6.5.1.10#2</td>
<td>A Source Shall populate unused Peak Current bit fields with zero.</td>
</tr>
<tr>
<td>6.5.1.10#3</td>
<td>Percentage Overload Shall be the maximum peak current reported in 10% increments as a percentage of the negotiated operating current (IoC) offered by the Source.</td>
</tr>
<tr>
<td>6.5.1.10#4</td>
<td>Overload Period Shall be the minimum rolling average time window in 20ms increments, where a value of 20ms is recommended.</td>
</tr>
<tr>
<td>6.5.1.10#5</td>
<td>Duty Cycle Shall be the maximum percentage of overload period reported in 5% increments.</td>
</tr>
<tr>
<td>6.5.1.10#6</td>
<td>VBUS Droop Shall be set to one to indicate there is an additional 5% voltage droop on VBUS when the overload conditions occur.</td>
</tr>
<tr>
<td>6.5.1.11#1</td>
<td>The Touch Temp field Shall report the IEC standard used to determine the surface temperature of the Source’s enclosure.</td>
</tr>
<tr>
<td>6.5.1.12#1</td>
<td>The Source Inputs field Shall identify the possible inputs that provide power to the Source.</td>
</tr>
<tr>
<td>6.5.1.13#1</td>
<td>The Batteries field Shall report the number of batteries the source supports.</td>
</tr>
<tr>
<td>6.5.1.13#2</td>
<td>It Shall independently report the number of Hot Swappable Batteries and the number of Fixed batteries.</td>
</tr>
<tr>
<td>6.5.1.13#3</td>
<td>The maximum number of each type of Battery Shall be no more than 4.</td>
</tr>
<tr>
<td>6.5.1.14#1</td>
<td>The Source PDP field Shall report the Source’s rated PDP as defined in Table 10-2.</td>
</tr>
<tr>
<td>6.5.2#1</td>
<td>The Status Message Shall be sent in response to a Get_Status Message.</td>
</tr>
<tr>
<td>6.5.2#2</td>
<td>The Status Message returns a 5-byte Status Data Block (SDB) whose format Shall be as shown in Figure 6-31 and Table 6-44.</td>
</tr>

Link Layer Tests

TD.PD.LL3.E1. GoodCRC Specification Revision compatibility

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port, Consumer Only, Consumer / Provider

Assertions Tested:

6.2.1.5#4

Description:

The Tester verifies the UUT accepts GoodCRC with Specification Revision set to 00b, 01b, or 10b.

Steps:

a) The Tester is configured to reply GoodCRC with Specification Revision set to 00b.
b) The Tester runs PROC.PD.E1 Bring-up according to the UUT role until the Tester has replied GoodCRC to the first message from the UUT.
c) The test fails if the UUT retransmits the last message.
d) Repeat the test with Specification Revision set to 01b and 10b in GoodCRC.

TD.PD.LL3.E2. Retransmission

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port, Consumer Only, Consumer / Provider

Assertions Tested:

6.6.1#2

Description:

The Tester verifies the UUT retransmit messages correctly.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap message to the UUT.
c) Upon receipt of the message in reply, the Tester doesn’t reply GoodCRC, and verifies the UUT retransmit the message nRetryCount times.
TD.PD.LL3.E3. GoodCRC Compatibility with PD2

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port, Consumer Only, Consumer / Provider, Cable

Assertions Tested:

Description:

The Tester verifies the UUT set Specification Revision to 01b in GoodCRC when the Tester is in PD2 mode.

Steps:

a) Put the Tester to PD2 mode, i.e. always set Specification Revision to 01b in PD messages.

b) Run PROC.PD.E1 Bring-up according to the UUT role until the Tester has received a GoodCRC from the UUT.

c) The Tester verifies the Specification Revision is 01b in the GoodCRC message.
Source Tests

TD.PD.SRC3.E1. Source Capabilities Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.5#6, 6.2.1.1.8#1, 6.4.1#3, 6.4.1#8

Description:
As Consumer (UFP), the Tester waits for a Source_Capabilities message from the Provider (DFP, UUT) and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up For DFP UUT steps a and b.
b) Upon receipt of the Source_Capabilities message from the Provider, the Tester verifies:
   1. **Number of Data Objects** field equals the number of Src_PDOs in the message and is not 000b.
   2. **Port Power Role** field = 1b (Source)
   3. **Specification Revision** field = 10b (Rev 3.0)
   4. **Port Data Role** field = 1b (DFP)
   5. **Message Type** field = 00001b (Source Capabilities)
   6. **Extended** field = 0b
c) For the first PDO, the Tester verifies:
   1. Bits 31..30 (PDO type) are 00b (Fixed Supply).
   2. Voltage field = 100 (5 V)
   3. Bits 23..22 = 000b (Reserved)
d) For the other PDOs (if any), the Tester verifies:
   1. If Bits 31..30 are 00b, Bits 29..22 are set to 0.
   2. If Bits 31..30 are 11b
      - Bits 29..28 are 00b (Programmable Power Supply)
      - Bits 26..25 are 00b (Reserved)
      - Bit 16 is 0b (Reserved)
      - Bit 7 is 0b (Reserved)
   3. PDOs are in the order of Fixed Supply Objects (if present), Battery Supply Objects (if present), Variable Supply Objects (if present) and then Programmable Power Supply Objects (if present).
4. Fixed Supply Objects (if present) are in voltage order; lowest to highest.
5. Battery Supply Objects (if present) are in Minimum Voltage order; lowest to highest.
6. Variable Supply Objects (if present) are in Minimum Voltage order; lowest to highest.
7. Programmable Power Supply Objects (if present) are in Maximum Voltage order; lowest to highest.

e) The test fails if any verification is not satisfied.

TD. PD. SRC3. E2. Accept Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.5#1, 6.2.1.1.5#7, 6.2.1.1.5#12, 6.2.1.1.8#1

Description:
As Consumer (UFP), the Tester requests 100% of the offered current or power under the terms of
the last PDO on the UUT, waits for an Accept message from the Provider (DFP, UUT) and verifies
correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up steps a-d according to the UUT role.
b) The Tester sends a Request, with Specification Revision in the message header set to 10b, for
power under the conditions of the last Power Data Object, requesting 100% of the current or
power offered depending on the type of the PDO.
c) Upon receipt of the Accept message, the Tester verifies:
1. Number of Data Objects field = 000b
2. Port Power Role field = 1b (Source)
3. Specification Revision field = 10b (Rev 3.0)
4. Port Data Role field = 1b (DFP)
5. Extended = 0b
d) The test fails if any verification is not satisfied.

TD. PD. SRC3. E3. PS_RDY Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.5#1, 6.2.1.1.5#7, 6.2.1.1.5#12, 6.2.1.1.8#1
Description:

As Consumer (UFP), the Tester requests 100% of the offered current or power under the terms of the last PDO on the UUT, waits for a **PS_RDY** message from the Provider (DFP, UUT) and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends a **Request**, with **Specification Revision** in the message header set to 10b, for power under the conditions of the last Power Data Object, requesting 100% of the current or power offered depending on the type of the PDO.

c) Upon receipt of the **Accept** message from the Provider, the Tester replies with a **GoodCRC** message.

d) Upon receipt of the **PS_RDY** message, the Tester verifies:

   1. **Number of Data Objects** field = 000b
   2. **Port Power Role** field = 1b (Source)
   3. **Specification Revision** field = 10b (Rev 3.0)
   4. **Port Data Role** field = 1b (DFP)
   5. **Extended** = 0b

e) The test fails if any verification is not satisfied.

**TD. PD. SRC3. E4. Specification Revision Check after Contract**

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

5.7#6, 5.7#7, 5.7#8, 5.7#9, 6.2.1.1.5#1, 6.2.1.1.5#7

Description:

As Consumer (UFP), the Tester verifies that the UUT continues to use Rev 3.0 after setting up a contract with the UUT using Rev 3.0.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a **Get_Source_Cap** message to the UUT.

c) Upon receipt of the **Source_Capabilities** Message, the Tester verifies the **Specification Revision** in the message header is 10b (Rev 3.0).
TD. PD. SRC3. E5. Source_Capabilities_Extended sent timely

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.12.1#6, 8.3.3.8.2.1#1, 8.3.3.8.2.1#2

Description:

As Consumer (UF), the Tester verifies that the UUT replies Get_Source_Cap_Extended message with a Source_Capabilities_Extended message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap_Extended message to the UUT.
c) If a Source_Capabilities_Extended or Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of Get_Source_Cap_Extended message EOP has been transmitted to the time the first bit of the Source_Capabilities_Extended message preamble has been received.

TD. PD. SRC3. E6. Source_Capabilities_Extended Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.4.1.2.2.7#5, 6.5#1, 6.5.1#1, 6.5.1.13#2, 6.5.1.13#3

Description:

As Consumer (UFP), the Tester sends a Get_Source_Cap_Extended message to the UUT, waits for a Source_Capabilities_Extended message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.
b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap_Extended message to the UUT.
c) If a Not_Supported message is received, the test passes and stops here.

d) Upon receipt of the Source_Capabilities_Extended message, the Tester verifies:
   1. Port Power Role field = 1b (Source)
   2. Specification Revision field = 10b (Rev 3.0)
   3. Port Data Role field = 1b (DFP)
   4. Extended = 1b
   5. Chunk Number in Extended Message Header = 0
   6. Request Chunk in Extended Message Header = 0
   7. Bit 9 (Reserved) in Extended Message Header = 0
   8. Data Size in Extended Message Header = 24
   9. If both UUT and the Tester support unchunked extended messages
      - Chunked bit in Extended Message Header = 0
      - Number of Data Objects field = 000b
   10. If either the UUT or the Tester doesn’t support unchunked extended messages
       - Chunked bit in Extended Message Header = 1
       - Number of Data Objects field = 7
       - The total number of data bytes is consistent with the Number of Data Objects field
       - The last 2 bytes of the 7th Data Object are 0
   11. For the SCEDB
       - Bits 0..1 of Voltage Regulation field = 00b or 01b
       - Bits 3..7 (Reserved) of Voltage Regulation field are 0
       - Bits 3..7 (Reserved) of Compliance field are 0
       - Bits 3..7 (Reserved) of Touch Current field are 0
       - Touch Temp field is 0, 1 or 2
       - If bit 0 of Source Inputs field is 0, bit 1 is 0
       - Bits 3..7 (Reserved) of Source Inputs field are 0
       - Upper Nibble of Number of Batteries/Battery Slots field (Number of Hot Swappable Battery Slots) <= 4
       - Lower Nibble of Number of Batteries/Battery Slots field (Number of Fixed Batteries) <= 4
       - Bit 7 (Reserved) of Source PDP field is 0
   12. If any field of Peak Current1, Peak Current2, or Peak Current3 in the SCEDB is not 0, the Tester verifies Peak Current is set to 0 in the Source_Capabilities message from the UUT.

e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)
TD. PD. SRC3. E7. Battery Status sent timely

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.4.5#1, 6.12.2#4, 8.3.3.11.2.1#1, 8.3.3.11.2.1#2

Description:

As Consumer (UFP), the Tester verifies that the UUT replies Get_Battery_Status message with a Battery_Status message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap_Extended message to the UUT.

c) If a Not_Supported message is received, and Num_Fixed_Batteries and Num_Swappable_Battery_Slots in the VIF are 0, the test passes and stops here.

b) If the Number of Batteries/Battery Slots field in the returned Source_Capabilities_Extended message is 0, the test passes and stops here.

e) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Battery_Status message to the UUT.

f) If a Battery_Status message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of Get_Battery_Status message EOP has been transmitted to the time the first bit of the Battery_Status message preamble has been received.

TD. PD. SRC3. E8. Battery Status Fields Checks

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.8#1, 6.4.5#3, 6.4.5#4, 6.4.5#5, 6.4.5#6, 6.4.5.2#1, 6.4.5.2#2, 6.4.5.2.2#1, 6.4.5.2.2#2, 6.4.5.2.3#1, 6.4.5.2.3#2

Description:

As Consumer (UFP), the Tester sends a Get_Battery_Status message to the UUT, verifies the UUT respond with a Battery_Status or Not_Supported message. If a Battery_Status message is received, the Tester verifies correct field values.
Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a `Get_Source_Cap_Extended` message to the UUT.

c) If a `Source_Capabilities_Extended` message is received, the Tester record the `Number of Batteries/Battery Slots` field. If a `Not_SUPPORTED` message is received, the Tester reads the `Number of Batteries/Battery Slots field` (combine Num_Fixed_Batteries and Num_Swappable_Battery_Slots) from the VIF.

d) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a `Get_Battery_Status` message to the UUT.

e) The Tester verifies a `Not_Supported` or `Battery_Status` message is received within `tReceiverResponse` max, and the UUT always replies with the same message type. i.e. The UUT cannot replies with a `Not_Supported` message sometimes and `Battery_Status` message other times.

f) If a `Battery_Status` message is received, the Tester verifies:
   1. `Number of Data Objects` field = 001b
   2. `Port Power Role` field = 1b (Source)
   3. `Specification Revision` field = 10b (Rev 3.0)
   4. `Port Data Role` field = 1b (DFP)
   5. `Extended` = 0b
   6. `Invalid Battery Reference` field (Bit 0) of the Battery Info field in the BSDO matches with the recorded `Number of Batteries/Battery Slots` field
   7. If `Battery Status Ref` referred to a fixed battery and `Invalid Battery Reference` field is 0, the `Battery is present` field (Bit 1) shall be 1
   8. If `Invalid Battery Reference` field is 1, `Battery is present` field shall be 0
   9. If Battery is present, `Battery charging status` (Bits 3..2) of Battery Info field is not 11b
   10. If Battery is not present, Bits 3..2 of Battery Info field is 00b
   11. Bits 7..4 of Battery Info field are 0
   12. Bits 7..0 of the BSDO are 0

g) Rerun steps d) to f) with `Battery Status Ref` set to 1 - 7

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.8#1, 6.4.5.2#1, 6.4.5.2#2, 6.4.5.2.1#1
Description:

As Consumer (UFP), the Tester sends a Get_Battery_Status message with an invalid battery reference to the UUT, waits for a Battery_Status message from the Provider (DFP, UUT) and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap_Extended message to the UUT.

c) If a Source_Capabilities_Extended message is returned, the Tester records the Number of Batteries/Battery Slots field. If a Not_Supported message is received, the Tester reads the Number of Batteries/Battery Slots field (combine Num_Fixed_Batteries and Num_Swappatable_Battery_Slots) from the VIF.

d) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Battery_Status message, with Battery Status Ref set to 8, to the UUT.

e) If a Not_Supported message is received, and
   1. If the recorded Number of Batteries/Battery Slots field is 0, the test passes and stops here.
   2. If the recorded Number of Batteries/Battery Slots field is not 0, the test fails.

f) Upon receipt of the Battery_Status message, the Tester verifies:
   1. Number of Data Objects field = 001b
   2. Port Power Role field = 1b (Source)
   3. Specification Revision field = 10b (Rev 3.0)
   4. Port Data Role field = 1b (DFP)
   5. Extended = 0b
   6. Invalid Battery Reference field (Bit 0) of the Battery Info field in the BSDO is 1
   7. Bits 7..1 of Battery Info field in the BSDO are 0
   8. Bits 7..0 of the BSDO are 0

TD, PD, SRC3, E10. Unrecognized Message Received in Ready State

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

 Assertions Tested:

6.3.14#1, 6.8.1#6, 8.3.3.5.1.1#1, 8.3.3.5.1.1#2
Description:
As Consumer (UFP), after setting up a contract with the UUT, the Tester sends an unrecognized message, with a reserved message type, to the UUT, and verifies the UUT replies with a \textit{Not\_Supported} message.

Steps:
\begin{enumerate}
  \item Run PROC.PD.E1 Bring-up according to the UUT role.
  \item The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a control message, with \textit{Message Type} set to 01110 (\textit{Reserved}), to the UUT.
  \item If a \textit{Not\_Supported} message is not received within \textit{tReceiverResponse} max, the test fails. This delay is measured from the time the last bit of unrecognized message EOP has been transmitted to the time the first bit of the \textit{Not\_Supported} message preamble has been received.
\end{enumerate}

\textbf{TD. PD. SRC3. E11. Get\_Status Fields Checks}

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
\begin{itemize}
  \item 6.2.1.1.1\#1, 6.2.1.1.5\#7, 6.2.1.1.8\#1, 8.3.3.7.4.1\#1, 8.3.3.7.4.1\#2, 8.3.3.7.4.1\#3, 8.3.3.9.3.1\#1, 8.3.3.9.3.1\#2
\end{itemize}

Description:
As Consumer (UFP), after setting up a contract with the UUT, the Tester sends an \textit{Alert} message to the UUT, waits for a \textit{Get\_Status} message from the UUT and verifies correct field values.

Steps:
\begin{enumerate}
  \item Run PROC.PD.E1 Bring-up according to the UUT role.
  \item The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends an \textit{Alert} message to the UUT, with bit 5 of \textit{Type of Alert} set to 1 (Source Input Change Event).
  \item If a \textit{Not\_Supported} message is received, the test passes and stops here.
  \item If a \textit{Get\_Status} message is not received within 500 ms after the \textit{Alert} message was sent, the test passes and stops here.
  \item Upon receipt of the \textit{Get\_Status} message, the Tester verifies:
    \begin{enumerate}
      \item \textit{Number of Data Objects} field = 000b
      \item \textit{Port Power Role} field = 1b (Source)
      \item \textit{Specification Revision} field = 10b (Rev 3.0)
      \item \textit{Port Data Role} field = 1b (DFP)
      \item \textit{Extended} = 0b
    \end{enumerate}
\end{enumerate}
TD. PD. SRC3. E12. Get_Battery_Status Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.4#2, 8.3.3.7.4.1#1, 8.3.3.7.4.1#2, 8.3.3.7.4.1#3, 8.3.3.11.1.1#1, 8.3.3.11.1.1#2

Description:

As Consumer (UFP), after setting up a contract with the UUT, the Tester sends an Alert message to the UUT, waits for a Get_Battery_Status message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends an Alert message to the UUT, with bit 1 (Battery Status Change Event) of Type of Alert set to 1, and B20 set to 1 (Battery 0).

c) If a Not_Supported message is received, the test passes and stops here.

d) If a Get_Battery_Status message is not received within 500 ms after the Alert message was sent, the test passes and stops here.

e) Upon receipt of the Get_Battery_Status message, the Tester verifies:
   1. **Port Power Role** field = 1b (Source)
   2. **Specification Revision** field = 10b (Rev 3.0)
   3. **Port Data Role** field = 1b (DFP)
   4. **Extended** = 1b
   5. **Chunk Number** in Extended Message Header = 0
   6. **Request Chunk** in Extended Message Header = 0
   7. Bit 9 (**Reserved**) in Extended Message Header = 0
   8. **Data Size** in Extended Message Header = 1
   9. If both the UUT and the Tester supports unchunked extended messages
      - **Chunked** bit in Extended Message Header = 0
      - **Number of Data Objects** field = 000b
   10. If either the UUT or the Tester doesn’t support unchunked extended messages
      - **Chunked** bit in Extended Message Header = 1
      - **Number of Data Objects** field = 001b
The total number of data bytes is consistent with the Number of Data Objects field.

- The last byte of the Data Object is 0

11. Battery Status Ref = 0

f) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

TD. PD. SRC3. E13. Status sent timely

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.3.16#1, 6.5.2#1, 8.3.3.9.2.1#1, 8.3.3.9.2.1#2

Description:
As Consumer (UFP), the Tester verifies that the UUT replies Get_Status message with a Status message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Status message to the UUT.

c) If a Status or Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of Get_Status message EOP has been transmitted to the time the first bit of the Status message preamble has been received.

TD. PD. SRC3. E14. Status Fields Checks

Applicable to:

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.2#2, 6.5.2#4, 6.5.2.4#2, 6.5.2.5#1

Description:
As Consumer (UFP), the Tester sends a Get_Status message to the UUT, waits for a Status message from the UUT and verifies correct field values.
Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Status message to the UUT.

c) If a Not_Supported message is received, the test passes and stops here.

d) Upon receipt of the Status message, the Tester verifies:

   1. Port Power Role field = 1b (Source)
   2. Specification Revision field = 10b (Rev 3.0)
   3. Port Data Role field = 1b (DFP)
   4. Extended = 1b
   5. Chunk Number in Extended Message Header = 0
   6. Request Chunk in Extended Message Header = 0
   7. Bit 9 (Reserved) in Extended Message Header = 0
   8. Data Size in Extended Message Header = 6
   9. If both the UUT and the Tester support unchunked extended messages
      - Chunked bit in Extended Message Header = 0
      - Number of Data Objects field = 00b
   10. If either the UUT or the Tester doesn’t support unchunked extended messages
      - Chunked bit in Extended Message Header = 1
      - Number of Data Objects field = 2
      - The total number of data bytes is consistent with the Number of Data Objects field
      - The last 1 byte of the 2\textsuperscript{nd} Data Object has zero value if Data Size (in Extended Message Header) = 5

11. For the SDB

   - Bit 0 of Present Input field = 0
   - Bits 5..7 of Present Input field are 0
   - If bit 3 of Present Input field is 0, Present Battery Input field shall be 0
   - Bit 0 and Bits 5..7 of Event Flags field are 0
   - OVT Event is not set in Event Flags field
   - Bit 0, Bits 3..7 of Temperature Status field are 0
   - Bit 0, Bits 6..7 of Power Status field are 0
   - If OTP event is set in Event Flags, Temperature Status shall be Over temperature. And vice versa.

e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)
TD. PD. SRC3. E15. Battery_Capabilities sent timely

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.5.3#1, 6.12.3#3, 8.3.3.10.2.1#1, 8.3.3.10.2.1#2

Description:
As Consumer (UFP), the Tester verifies that the UUT replies `Get_Battery_Cap` message with a `Battery_Capabilities` message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a `Get_Source_Cap_EXTENDED` message to the UUT.
c) If a `Not_Supported` message is received, and the Num_Fixed_Batteries and Num_Swappable_Battery_Slots in the VIF are 0, the test passes and stops here.
d) If the Number of Batteries/Battery Slots field in the returned `Source_Capabilities_EXTENDED` message is 0, the test passes and stops here.
e) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a `Get_Battery_Cap` message to the UUT.
f) If a `Battery_Capabilities` message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of `Get_Battery_Cap` message EOP has been transmitted to the time the first bit of the `Battery_Capabilities` message preamble has been received.

TD. PD. SRC3. E16. Battery_Capabilities Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.5#2, 6.5.5.3.2#1

Description:
As Consumer (UFP), the Tester sends a `Get_Battery_Cap` message, verifies the UUT respond with a `Battery_Capabilities` or `Not_Supported` message. If a `Battery_Capabilities` is received, the Tester verifies correct field values.
Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap_EXTENDED message to the UUT.

c) If a Source_Capabilities_EXTENDED message is received, the Tester record the Number of Batteries/Battery Slots field. If a Not_Supported message is received, the Tester reads the Number of Batteries/Battery Slots field (combine Num_Fixed_Batteries and Num_Swappable_Battery_Slots) from the VIF.

d) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Battery_Cap message to the UUT, with Battery Cap Ref set to 0.

e) The Tester verifies a Not_Supported or Battery_Capabilities message is received within tReceiverResponse max, and the UUT always replies with the same message type. i.e. The UUT cannot replies with a Not_Supported message sometimes and Battery_Capabilities message other times.

f) If a Battery_Capabilities message is received, the Tester verifies:
   1. Port Power Role field = 1b (Source)
   2. Specification Revision field = 10b (Rev 3.0)
   3. Port Data Role field = 1b (DFP)
   4. Extended = 1b
   5. Chunk Number in Extended Message Header = 0
   6. Request Chunk in Extended Message Header = 0
   7. Bit 9 (Reserved) in Extended Message Header = 0
   8. Data Size in Extended Message Header = 9
   9. If both the UUT and the Tester supports unchunked extended messages
      – Chunked bit in Extended Message Header = 0
      – Number of Data Objects field = 000b
   10. If either the UUT or the Tester doesn’t support unchunked extended messages
      – Chunked bit in Extended Message Header = 1
      – Number of Data Objects field = 3
      – The total number of data bytes is consistent with the Number of Data Objects field
      – The last byte of the 3rd Data Object is 0
   11. For the BCDB
      – Invalid Battery reference bit of Battery Type field matches with the recorded Number of Batteries/Battery Slots field
      – Bits 1..7 of Battery Type field are 0

g) Rerun steps d) to f) with Battery Cap Ref set to 1 - 7
h) Rerun the test, not including step g), with Unchunked Extended Messages Supported set to 0 in step a)

Description:

As Consumer (UFP), the Tester sends a Get_Manufacturer_Info message, in which Manufacturer Info Target is set to 2, to the UUT, wait for a Manufacturer_Info message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Manufacturer_Info message, in which Manufacturer_Info Target is set to 2, to the UUT.

c) If a Not_Supported message is received, the test passes and stops here.

d) Upon receipt of the Manufacturer_Info message, the Tester verifies:

1. Port Power Role field = 1b (Source)
2. Specification Revision field = 10b (Rev 3.0)
3. Port Data Role field = 1b (DFP)
4. Extended = 1b

5. Chunk Number in Extended Message Header = 0
6. Request Chunk in Extended Message Header = 0
7. Bit 9 (Reserved) in Extended Message Header = 0
8. Data Size in Extended Message Header is 18 (PID + VID + “Not Supported” + null)
9. If both the UUT and the Tester support unchunked extended messages
   – Chunked bit in Extended Message Header = 0
   – Number of Data Objects field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
    – Chunked bit in Extended Message Header = 1
    – Number of Data Objects field = 5
    – The total number of data bytes is consistent with the Number of Data Objects field
11. **Manufacturer String** in Manufacturer Info Data Block = null terminated ASCII text string “Not Supported”

e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SRC3. E21. Manufacturer_Info Fields Checks - Invalid Manufacturer Info Ref**

**Applicable to:**

- **UUT:** Provider Only, Provider / Consumer, Dual-role Port

**Assertions Tested:**

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.7#2, 6.5.7.3#2

**Description:**

As Consumer (UFP), the Tester sends a **Get_Manufacturer_Info** message with an invalid **Manufacturer Info Ref** to the UUT, waits for a **Manufacturer_Info** message from the UUT, and verifies correct field values.

**Steps:**

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a **Get_Manufacturer_Info** message, in which **Manufacturer Info Target** is set to 1 and **Manufacturer Info Ref** is set to 8, to the UUT.

c) If a **Not_Supported** message is received, the test passes and stops here.

d) Upon receipt of the **Manufacturer_Info** message, the Tester verifies:

1. **Port Power Role** field = 1b (Source)
2. **Specification Revision** field = 10b (Rev 3.0)
3. **Port Data Role** field = 1b (DFP)
4. **Extended** = 1b
5. **Chunk Number** in Extended Message Header = 0
6. **Request Chunk** in Extended Message Header = 0
7. Bit 9 (Reserved) in Extended Message Header = 0
8. **Data Size** in Extended Message Header is 18 (PID + VID + “Not Supported” + null)
9. If both the UUT and the Tester support unchunked extended messages
   - **Chunked** bit in Extended Message Header = 0
   - **Number of Data Objects** field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
    - **Chunked** bit in Extended Message Header = 1
Power Delivery 3.0 Tests

- **Number of DataObjects** field = 5
- The total number of data bytes is consistent with the **Number of DataObjects** field

11. **Manufacturer String** in Manufacturer Info Data Block = null terminated ASCII text string “Not Supported”

e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SRC3. E22. Cable Type Detection**

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

4.4#1, 4.4#2, 4.4#5, 10.2.3.2#6

Description:

As Consumer (UFP), the Tester verifies that the UUT does cable detection if it offers currents in excess of 3A and/or voltages in excess of 20V.

Steps:

a) If Captive_Cable is set to YES in the VIF, the test passes and stops here.
b) The test starts in a disconnected state.
c) The Tester applies Rd and Ra and waits for a connection with the UUT.
d) If a **SOP' Discover Identity** message is received, the Tester replies as Passive Cable with Vbus Current Handling Capability set to 5A and Maximum VBus Voltage set to 50V.
e) Upon receipt of the **Source Capabilities** message from the UUT, the Tester checks whether the UUT offers currents in excess of 3A and/or voltages in excess of 20V. If so and no **SOP' Discovery Identity** message was received, the test fails; if not, the test passes and stops here.
f) The Tester removes all terminations and simulates a disconnection.
g) The Tester applies Rd and Ra and waits for a connection with the UUT.
h) If a **SOP' Discover Identity** message is received, the Tester replies as Passive Cable with Vbus Current Handling Capability set to 3A and Maximum VBus Voltage set to 20V.
i) Upon receipt of the **Source Capabilities** message from the UUT, the Tester checks whether the UUT offers currents in excess of 3A and/or voltages in excess of 20V. If so, the test fails.
Power Delivery 3.0 Tests

TD. PD. SRC3. E23. Vconn Swap

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.3.3#4, 6.3.11#7, 6.3.11#8, 6.3.11#10, 6.3.11#11, 6.3.12.4#1, 6.3.12.4#2

Description:
As Consumer (UFP), the Tester verifies that the UUT accepts VCONN_Swap when it’s presently the Vconn source.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) In addition to emulating a UFP, the Tester will also present Ra and will reply to SOP' Discover Identity as a Passive Cable with Vbus Current Handling Capability set to 5A and Maximum VBus Voltage set to 20V.

c) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a VCONN_Swap message to the UUT.

d) If an Accept or Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of VCONN_Swap message EOP has been transmitted to the time the first bit of the Accept or Not_Supported message preamble has been received.

e) The Tester verifies the UUT never sources VConn if the message received in d) is Not_Supported.

TD. PD. SRC3. E24. Unexpected Message Received in Ready State

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.8.1#4

Description:
As Consumer (UFP), after setting up a contract with the UUT, the Tester sends a unexpected message, to the UUT, and verifies the UUT does Soft Reset.
Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends an *Accept Message* to the UUT.

c) If a *Soft Reset* message is not received within $t_{ProtErrSoftReset}$ max, the test fails. This delay is measured from the *EOP* of the *GoodCRC* corresponding to the *Accept message* has been received to the time the *EOP* the *Soft Reset* message has been received.

**TD. PD. SRC3. E25. Receiving chunked extended message**

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.5.7#1, 6.6.17.1#1, 6.6.17.1#2, 6.11.2.1.1.1#1, 6.11.2.1.2.1#3, 6.11.2.1.2.2#1, 6.11.2.1.2.3#2, 6.11.2.1.2.3#3, 6.11.2.1.2.4#1, 6.11.2.1.2.4#2, 6.11.2.1.2.5#2, 8.3.3.5.1.3#1, 8.3.3.5.1.3#2, 8.3.3.5.1.3#3, 8.3.3.12.2.1#1, 8.3.3.12.2.1#2

Description:

As Consumer (UFP), the Tester verifies that the UUT receives a chunked extended message correctly by sending messages to request chunks.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported set to 0 in *Request* message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends the first chunk of a chunked extended message to the UUT, with *Data Size* set to 260 and *Message Type* set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

c) If a message is not received within $t_{ChunkingNotSupported}$ max, this test fails. The delay is measured from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

d) If the received message is *Not_Supported*, the Tester verifies the message is received after $t_{ChunkingNotSupported}$ min and stops here.

e) If the message is not received within $t_{ChunkReceiverRequest}$ max, the test fails.

f) Upon receipt of the response from the UUT, the Tester verifies the following:

   1. For Message Header
      
      - *Extended* = 1
      - *Number of Data Objects* = 1
      - Port Power Role field = 1b (Source)
      - Port Data Role field = 1b (DFP)
2. For Extended Message Header
   - **Chunked** = 1
   - **Chunk Number** = next chunk in the series
   - **Request Chunk** = 1
   - **Bit 9** = 0 (Reserved)
   - **Data Size** = 0

   g) The Tester sends the requested chunk to the UUT.
   h) Repeat e) and g) until the Tester has finished sending all 10 chunks.

**TD. PD. SRC3. E26. Soft_Reset sent regardless of Rp value**

Applicable to:
- **UUT:** Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.8.1#7

Description:
As Consumer (UFP), the Tester forces the UUT to send Soft_Reset and verifies Soft_Reset is sent regardless of the Rp value is SinkTxOK or SinkTxNG.

Steps:
   a) Run PROC.PD.E1 Bring-up according to the UUT role.
   b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a **Get_Source_Cap** message to the UUT.
   c) Upon receipt of the **Source_Capabilities** Message, the Tester doesn’t reply with GoodCRC.
   d) The Tester verifies that a **Soft_Reset** message is sent by the UUT within **tReceive** max + **tSoftReset** max, the delay is measured from the time the last bit of the last retransmitted **Source_Capabilities** Message **EOP** has been received to the time the last bit of the **Soft_Reset** message **EOP** has been received.

**TD. PD. SRC3. E27. PPS_Status Sent Timely**

Applicable to:
- **UUT:** Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.3.18#1, 6.5.10#1, 6.12.1#10, 6.12.3#10, 8.3.3.9.6.1#1, 8.3.3.9.6.1#2
**Power Delivery 3.0 Tests**

**Description:**

As Consumer (UFP), the Tester verifies that the UUT replies *Get_PPS_Status* message with a *PPS_Status* message timely.

**Steps:**

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a *Get_PPS_Status* message to the UUT.

c) If a *PPS_Status* message is not received within *tReceiverResponse* max, the test fails. This delay is measured from the time the last bit of *Get_PPS_Status* message EOP has been transmitted to the time the first bit of the *PPS_Status* message preamble has been received.

**TD. PD. SRC3. E28. PPS_Status Fields Check**

**Applicable to:**
- **UUT:** Provider Only, Provider / Consumer, Dual-role Port

**Assertions Tested:**

6.5.10#3, 6.5.10.1#1, 6.5.10.1#2, 6.5.10.2#1, 6.5.10.2#2, 6.5.10.3#1, 6.5.10.3#2

**Description:**

As Consumer (UFP), the Tester sends a *Get_PPS_Status* message to the UUT, wait for a *PPS_Status* message from the UUT and verifies correct field values.

**Steps:**

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in *Request* message during this process.

b) The Tester doesn’t draw any current, waits until it can start an AMS (Run PROC.PD.E3) and sends a *Get_PPS_Status* message to the UUT.

c) Upon receipt of the *PPS_Status* message, the Tester verifies:

1. *Port Power Role* field = 1b (Source)
2. *Specification Revision* field = 10b (Rev 3.0)
3. *Port Data Role* field = 1b (DFP)
4. *Extended* = 1b
5. *Chunk Number* in Extended Message Header = 0
6. *Request Chunk* in Extended Message Header = 0
7. Bit 9 (*Reserved*) in Extended Message Header = 0
8. *Data Size* in Extended Message Header is 4
9. If both the UUT and the Tester support unchunked extended messages

**Source Tests | 80 of 137**
– **Chunked** bit in Extended Message Header = 0
– **Number of Data Objects** field = 000b

10. If either the UUT or the Tester doesn’t support unchunked extended messages
– **Chunked** bit in Extended Message Header = 1
– **Number of Data Objects** field = 2
– The total number of data bytes is consistent with the **Number of Data Objects** field
– The last 2 bytes of the 2nd Data object are 0

11. For the PPSSDB
– Output Voltage field shall be within ±3% of the actual output voltage rounded to the nearest 20mV or 0xFFFF
– Output Current field shall be 0x00 to 0x03(inclusive) or 0xFF
– For Real Time Flags field
  o Bit 0 shall be 0
  o PTF shall be 0x00 (Not Supported) or 0x01 (Normal)
  o OMF shall be 0 (Constant Voltage mode)
  o Bits 4..7 shall be 0

  d) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SRC3. E29. SourcePPSCommTimer Deadline**

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.6.18.2#1, 6.6.18.2#2, 6.6.18.2#3, 6.6.18.2#4

Description:
As Consumer (UFP), the Tester sends the second **Request** message after **tPPSRequest** max, verifies SourcePPSCommTimer is not timeout at the UUT and the timer is correctly reinitialized.

Steps:

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role.

b) If a Hard Reset is received within **tPPSRequest** max, the test fails. The delay is measured from the time the last bit of the **EOP** of the **GoodCRC** Message sent by the UUT in response to the previous **Request** Message to the time the first bit of the **Hard Reset** is received.

c) The Tester sends the second **Request** Message to request the PPS APDO at 4V 1A, **tPPSRequest** max after the previous **Request** Message, and verifies the UUT responds with an **Accept** and
then **PS_RDY** message. If the Tester cannot send the second **Request** Message because it cannot start an AMS, the test fails.

d) If a Hard Reset is received within **tPPSRequest** max, the test fails. The delay is measured from the time the last bit of the **EOP** of the **GoodCRC** Message sent by the UUT in response to the second **Request** Message to the time the first bit of the **Hard Reset** is received.

**TD. PD. SRC3. E30. SourcePPSCommTimer Timeout**

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
- 6.4.1.2#10, 6.6.18.2#1, 6.6.18.2#2, 6.6.18.2#5, 8.3.3.2.6#6

Description:
As Consumer (UFP), the Tester intentionally does not send the second **Request** message, in order to force a SourcePPSCommTimer timeout on the UUT and verifies it is correctly implemented.

Steps:

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role.

b) The Tester intentionally does not send the second **Request** Message, if a Hard Reset is received before **tPPSTimeout** min, or not received within **tPPSTimeout** max, the test fails. The delay is measured from the time the last bit of the **EOP** of the **GoodCRC** Message sent by the UUT in response to the previous **Request** Message to the time the first bit of the **Hard Reset** is received.

**TD. PD. SRC3. E31. SourcePPSCommTimer Stopped**

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
- 6.4.1.2#11, 6.6.18.2#1

Description:
As Consumer (UFP), the Tester request a PPS APDO first and then request a fixed PDO, verifies SourcePPSCommTimer is stopped at the UUT.

Steps:

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role.
b) The Tester wait till it can start an AMS and sends the second Request Message to request the fixed PDO at 5V 0.5A, and verifies the UUT responds with an Accept and then PS_RDY message.

c) If a Hard Reset is received within $t_{PPSTimeout}$ max, the test fails. The delay is measured from the time the last bit of the EOP of the GoodCRC Message sent by the UUT in response to the second Request Message to the time the first bit of the Hard Reset is received.

**TD. PD. SRC3. E32. ChunkSenderResponseTimer Timeout**

**Applicable to:**
- UUT: Provider Only, Provider / Consumer, Dual-role Port

**Assertions Tested:**
6.6.17.3#1, 6.6.17.3#2, 6.6.17.3#5, 6.11.2.1.2.5#1, 6.11.2.1.2.5#3, 6.11.2.1.2.6#4

**Description:**
As Consumer (UFP), the Tester verifies that the UUT recovers correctly after the Tester stops sending chunked messages in the middle.

**Steps:**

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported set to 0 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends the first chunk of a chunked extended message to the UUT, with Data Size set to 260 and Message Type set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

c) If a message is not received within $t_{ChunkingNotSupported}$ max, this test fails. The delay is messaged from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

d) If the received message is Not_Supported, the Tester verifies the message is received after $t_{ChunkingNotSupported}$ min and stops here.

e) If the message is not received within $t_{ChunkReceiverRequest}$ max, the test fails.

f) Upon receipt of the message from the UUT to request for the next chunk, the Tester sends the requested chunk to the UUT.

g) Repeat f) until the Tester has finished sending 4 chunks and intentionally does not send the 5th chunk to the UUT.

h) The Tester waits for $t_{ChunkSenderResponse}$ max + 5 ms, waits until it can start an AMS (Run PROC.PD.E3) and sends the first chunk to the UUT.

i) If a message is not received within $t_{ChunkReceiverRequest}$ max, the test fails.

j) Upon receipt of the message, the Tester verifies the following:

1. For Message Header
   - Extended = 1
   - Number of Data Objects = 1
Power Delivery 3.0 Tests

- Port Power Role field = 1b (Source)
- Port Data Role field = 1b (DFP)
- **Specification Revision** = 10b (Rev 3.0)
- **Message Type** = 11111b

2. For Extended Message Header
   - **Chunked** = 1
   - **Chunk Number** = 1
   - **Request Chunk** = 1
   - **Bit 9** = 0 (Reserved)
   - **Data Size** = 0

3. The total number of data bytes is consistent with the **Number of Data Objects** field

4. The last 2 bytes of the Data Object are 0

**TD. PD. SRC3. E33. Country_Codes Sent Timely**

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.3.19#1, 6.5.11#1, 8.3.3.13.2.1#1, 8.3.3.13.2.1#2

Description:

As Consumer (UFP), the Tester verifies that the UUT replies **Get_Country_Codes** message with a **Country_Codes** or **Not_Supported** message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a **Get_Country_Codes** message to the UUT.

c) If a **Country_Codes** or **Not_Supported** message is not received within **tReceiverResponse** max, the test fails. This delay is measured from the time the last bit of **Get_Country_Codes** message EOP has been transmitted to the time the first bit of the **Country_Codes** message preamble has been received.
TD. PD. SRC3. E34. Country_Codes Fields Checks

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
6.5.11#2, 6.5.11.1#1

Description:
As Consumer (UFP), the Tester sends a Get_Country_Codes message to the UUT, wait for a Country_Codes message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Country_Codes message to the UUT.

c) If a Not_Supported message is received, the test passes and stops here.

d) Upon receipt of the Country_Codes message, the Tester verifies:

1. Port Power Role field = 1b (Source)
2. Specification Revision field = 10b (Rev 3.0)
3. Port Data Role field = 1b (DFP)
4. Extended = 1b
5. Request Chunk in Extended Message Header = 0
6. Bit 9 (Reserved) in Extended Message Header = 0
7. Data Size in Extended Message Header is 4..260, and is the same as that in the first Chunk
8. If both the UUT and the Tester support unchunked extended messages
   - Chunked bit in Extended Message Header = 0
   - Number of Data Objects field = 000b
   - Chunk Number in Extended Message Header = 0
   - The actual bytes in CCDB matches with Data Size
9. If either the UUT or the Tester doesn’t support unchunked extended messages
   - Chunked bit in Extended Message Header = 1
   - Chunk Number in Extended Message Header is correctly set
   - Number of Data Objects field = 7 or (Remaining Data Size + 5) / 4 (whichever is smaller)
   - The Packet payload is padded to the next 4-byte Data Object boundary with zeros (0x00) if this is the last Chunk.
10. For the CCDB
   - Length = (Data Size) / 2 − 1
   - All other bytes are ascii codes of capital letters (65 – 90 inclusive)
   11. The Tester Requests for the next Chunk if the message is chunked and this is not the last Chunk, and go to step d)
      e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SRC3. E35. Country_Info Sent Timely**

**Applicable to:**
- UUT: Provider Only, Provider / Consumer, Dual-role Port

**Assertions Tested:**
6.5.12#1, 8.3.3.13.4.1#1, 8.3.3.13.4.1#2

**Description:**
As Consumer (UFP), the Tester verifies that the UUT replies Get_Country_Info message with a Country_Info or Not_Supported message timely.

**Steps:**

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Country_Codes message to the UUT.
c) If a Not_Supported message is received, the test passes and stops here.
d) For each Country Code, the Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Country_Info message to the UUT.
e) If a Country_Info message is not received within \( t_{ReceiverResponse} \) max, the test fails. This delay is measured from the time the last bit of Get_Country_Info message EOP has been transmitted to the time the first bit of the Country_Info message preamble has been received.
f) If the Country_Info is chunked, the Tester finishes receiving the message.

**TD. PD. SRC3. E36. Country_Info Fields Checks**

**Applicable to:**
- UUT: Provider Only, Provider / Consumer, Dual-role Port

**Assertions Tested:**
6.5.12#2, 6.5.12.1#1
Description:

As Consumer (UFP), the Tester sends a `Get_Country_Info` message to the UUT, wait for a `Country_Info` message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Uncunked Extended Messages Supported to 1 in Request message during this process.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a `Get_Country_Codes` message to the UUT.

c) If a `Not_Supported` message is received, the test passes and stops here.

d) For the first Country Code, the Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a `Get_Country_Info` message to the UUT.

e) Upon receipt of the `Country_Info` message, the Tester verifies:
   1. `Port Power Role` field = 1b (Source)
   2. `Specification Revision` field = 10b (Rev 3.0)
   3. `Port Data Role` field = 1b (DFP)
   4. `Extended` = 1b
   5. `Request Chunk` in Extended Message Header = 0
   6. Bit 9 (`Reserved`) in Extended Message Header = 0
   7. `Data Size` in Extended Message Header is 4..260, and is the same as that in the first Chunk
   8. If both the UUT and the Tester support unchunked extended messages
      - `Chunked` bit in Extended Message Header = 0
      - `Number of Data Objects` field = 000b
      - `Chunk Number` in Extended Message Header = 0
      - The actual bytes in CIDB matches with `Data Size`
   9. If either the UUT or the Tester doesn’t support unchunked extended messages
      - `Chunked` bit in Extended Message Header = 1
      - `Chunk Number` in Extended Message Header is correctly set
      - `Number of Data Objects` field = 7 or (Remaining Data Size + 5) / 4 (whichever is smaller)
      - The Packet payload is padded to the next 4-byte Data Object boundary with zeros (0x00) if this is the last Chunk.
   10. For the CIDB
       - `Country Code` field is the same as that in the Get_Country_Info message
       - Byte 2 and Byte 3 are 0
   11. The Tester Requests for the next Chunk if the message is chunked and this is not the last Chunk, and go to step d)
f) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)
Sink Tests

TD. PD. SNK3. E1. Request Fields Checks

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

- 6.2.1.1.1#1, 6.2.1.1.5#1, 6.2.1.1.5#6, 6.2.1.1.8#1

Description:

As Provider, the Tester waits for a Request message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role until step e).

b) Upon receipt of the Request message, the Tester verifies:
   1. Number of Data Objects field = 001b
   2. MessageID field = 000b
   3. Port Power Role field = 0b (Sink)
   4. Port Data Role field = 0b (UFP)
   5. Specification Revision field = 10b (Rev 3.0)
   6. Extended Field = 0b

c) For the Sink Request Data Object, the Tester verifies:
   1. Object position field is valid.
   2. The Operating Current/Power is less than or equal to the maximum current/power offered in the Source_Capabilities Message.
   3. If GiveBack flag is 0
      - The Maximum Operating Current/Power is larger than or equal to the Operating Current/Power.
      - If Capability Mismatch bit is 0, the Maximum Operating Current/Power is less than or equal to the maximum current/power offered in the Source_Capabilities Message.
   4. If GiveBack flag is 1, the Minimum Operating Current/Power is less than the Operating Current/Power.
   5. Bit 31 = 0b (Reserved)
   6. Bits 22..20 = 000b (Reserved)

d) The test fails if any verification is not satisfied.
TD. PD. SNK3. E2. Unrecognized Message Received in Ready State

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
6.3.14#1, 6.8.1#6, 8.3.3.5.2.1#1, 8.3.3.5.2.1#2

Description:
As Provider (DFP), after setting up a contract with the UUT, the Tester sends an unrecognized message, with a reserved Message Type, to the UUT, and verifies the UUT reply with a Not_Supported message.

Steps:
  a) Run PROC.PD.E1 Bring-up according to the UUT role.
  b) The Tester sends a control message, with Message Type set to 01110, to the UUT.
  c) If a Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of unrecognized message EOP has been transmitted to the time the first bit of the Not_Supported message preamble has been received.

TD. PD. SNK3. E3. Get_Source_Cap_Extended Fields Checks

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.5#7, 6.4.1.2.2.7#6, 6.11.2.2.3.1#1, 6.11.2.2.3.1#2, 6.11.2.2.3.2#1, 8.3.3.8.1.1#1, 8.3.3.8.1.1#2

Description:
As Provider (DFP), after setting up a contract with the UUT, the Tester waits for a Get_Source_Cap_Extended message from the Consumer (UUT) and verifies correct field values.

Steps:
  a) Run PROC.PD.E1 Bring-up according to the UUT role. In Source_Capabilities message, the Tester sets Peak Current of fixed supply PDOs to 0.
  b) The Tester sets termination to SinkTxOk.
  c) If a Get_Source_Cap_Extended message is not received within 500 ms after termination set to SinkTxOk, the test passes and stops here.
d) Upon receipt of the *Get_Source_Cap_Extended* message, the Tester verifies:
   1. **Number of Data Objects** field = 000b
   2. **Port Power Role** field = 0b (Sink)
   3. **Specification Revision** field = 10b (Rev 3.0)
   4. **Port Data Role** field = 0b (UFP)
   5. **Extended** = 0b

**TD. PD. SNK3. E4. SenderResponseTimer Deadline - Source_Capabilities_Extended**

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

8.3.3.8.1.1#1, 8.3.3.8.1.1#2, 8.3.3.8.1.1#3, 8.3.3.8.1.1#4

Description:

As Provider (DFP), the Tester verifies that the UUT accepts a *Source_Capabilities_Extended* message sent at the deadline limit of *tSenderResponse* min in reply to *Get_Source_Cap_Extended* message.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. In *Source_Capabilities* message, the Tester sets Peak Current of fixed supply PDOs to 0.

b) The Tester sets termination to *SinkTxOk*.

c) If a *Get_Source_Cap_Extended* message is not received within 500 ms after termination set to *SinkTxOk*, the test passes and stops here.

d) Upon receipt of the *Get_Source_Cap_Extended* message from the UUT, the Tester replies with a *GoodCRC* message.

e) The Tester sends a *Source_Capabilities_Extended* message at the deadline limit of *tSenderResponse* min after the *GoodCRC* message. This delay is measured from the time the last bit of the *GoodCRC* message has been transmitted to the time the last bit of the *Source_Capabilities_Extended* message has been transmitted.

f) The Tester verifies a *GoodCRC* message corresponding to the *Source_Capabilities_Extended* message is received.

g) The Tester verifies a *Soft Reset* is not detected after *tProtErrSoftReset* max from the time the *EOP* of the *GoodCRC* sent in response to the *Source_Capabilities_Extended* message has been received.
TD. PD. SNK3. E5. SenderResponseTimer Timeout - Source_Capabilities_Extended

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
8.3.3.8.1.1#1, 8.3.3.8.1.1#2, 8.3.3.8.1.1#3, 8.3.3.8.1.1#4

Description:
As Provider (DFP), the Tester intentionally does not send the Source_Capabilities_Extended message in reply to a Get_Source_Cap_EXTENDED message from the UUT, in order to force a SenderResponseTimer timeout on the UUT and verifies it is correctly implemented.

Steps:
a) Run PROC.PD.E1 Bring-up according to the UUT role. In Source_Capabilities message, the Tester sets Peak Current of fixed supply PDOs to 0.
b) The Tester sets termination to SinkTxOk.
c) If a Get_Source_Cap_EXTENDED message is not received within 500 ms after termination set to SinkTxOk, the test passes and stops here.
d) Upon receipt of the Get_Source_Cap_EXTENDED message from the UUT, the Tester replies with a GoodCRC message.
e) The Tester intentionally does not send the Source_Capabilities_Extended message in reply to the Get_Source_Cap_EXTENDED message from the UUT, in order to force a SenderResponseTimer timeout on the UUT.
f) If a Hard Reset or Soft Reset is detected within tSenderResponse max from the time the last bit of the GoodCRC message EOP has been sent, the test fails.

TD. PD. SNK3. E6. Get_Status Fields Checks

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.11.2.2.3.1#1-2, 6.11.2.2.3.2#1, 8.3.3.7.2.1#1, 8.3.3.7.2.1#2, 8.3.3.7.2.1#3, 8.3.3.9.1.1#1, 8.3.3.9.1.1#2

Description:
As Provider (DFP), after setting up a contract with the UUT, the Tester sends an Alert message to the UUT, waits for a Get_Status message from the Consumer (UUT) and verifies correct field values.
Power Delivery 3.0 Tests

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends an Alert message to the UUT, with bit 3 of Type of Alert set (OTP event).

c) The Tester sets termination to SinkTxOk.

d) If a Get_Status message is not received within 500 ms after termination set to SinkTxOk, the test passes and stops here.

e) Upon receipt of the Get_Status message, the Tester verifies:

1. Number of Data Objects field = 000b
2. Port Power Role field = 0b (Sink)
3. Specification Revision field = 10b (Rev 3.0)
4. Port Data Role field = 0b (UFP)
5. Extended = 0b

TD. PD. SNK3. E7. Get_Battery_Status Fields Checks

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.4#2, 6.5.4#3, 6.11.2.2.3.1#1, 6.11.2.2.3.1#2, 6.11.2.2.3.2#1, 8.3.3.7.2.1#1, 8.3.3.7.2.1#2, 8.3.3.7.2.1#3, 8.3.3.11.1.1#1, 8.3.3.11.1.1#2

Description:

As Provider (DFP), after setting up a contract with the UUT, the Tester sends an Alert message to the UUT, waits for a Get_Battery_Status message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Source_Capabilities message during this process.

b) The Tester sends an Alert message to the UUT, with bit 1 (Battery Status Change Event) of Type of Alert set to 1, and B20 set to 1 (Battery 0).

c) The Tester sets termination to SinkTxOk.

d) If a Get_Battery_Status message is not received within 500 ms after the Alert message was sent, the test passes and stops here.

e) Upon receipt of the Get_Battery_Status message, the Tester verifies:

1. Port Power Role field = 0b (Sink)
2. Specification Revision field = 10b (Rev 3.0)
3. **Port Data Role field = 0b (UFP)**
4. **Extended = 1b**
5. **Chunk Number** in Extended Message Header = 0
6. **Request Chunk** in Extended Message Header = 0
7. Bit 9 (**Reserved**) in Extended Message Header = 0
8. **Data Size** in Extended Message Header = 1
9. If both the UUT and the Tester support unchunked extended messages
   - **Chunked** bit in Extended Message Header = 0
   - **Number of Data Objects** field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
    - **Chunked** bit in Extended Message Header = 1
    - **Number of Data Objects** field = 001b
    - The total number of data bytes is consistent with the **Number of Data Objects** field
    - The last byte of the Data Object is 0
11. **Battery Status Ref = 0**
   f) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SNK3. E8. Status sent timely**

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
- 6.3.16#1, 6.5.2#1, 8.3.3.9.4.1#1, 8.3.3.9.4.1#2

Description:
As Provider (DFP), the Tester verifies that the UUT replies **Get_Status** message with a **Status** message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester sends a **Get_Status** message to the UUT.
c) If a **Status** or **Not_Supported** message is not received within **tReceiverResponse** max, the test fails. This delay is measured from the time the last bit of **Get_Status** message **EOP** has been transmitted to the time the first bit of the **Status** message preamble has been received.
TD. PD. SNK3. E9. Manufacturer_Info Sent Timely

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
6.5.6#1, 6.5.7#1, 8.3.3.12.2.1#1, 8.3.3.12.2.1#2

Description:
As Provider (DFP), the Tester verifies that the UUT replies Get_Manufacturer_Info message with a Manufacturer_Info message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester sends a Get_Manufacturer_Info message to the UUT.
c) If a Manufacturer_Info or Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of Get_Manufacturer_Info message EOP has been transmitted to the time the first bit of the Manufacturer_Info message preamble has been received.

TD. PD. SNK3. E10. Source_Capabilities_Extended sent timely

Applicable to:
- UUT: Consumer / Provider, Dual-role Port

Assertions Tested:
6.12.1#6, 8.3.3.16.12.1#1, 8.3.3.15.12.1#2

Description:
As Provider (DFP), the Tester verifies that the UUT replies Get_Source_Cap_Extended message with a Source_Capabilities_Extended message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester sends a Get_Source_Cap_Extended message to the UUT.
c) If a Source_Capabilities_Extended or Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of Get_Source_Cap_Extended message EOP has been transmitted to the time the first bit of the Source_Capabilities_Extended message preamble has been received.
TD. PD. SNK3. E11. Receiving chunked extended message

Applicable to:
UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.5.7#1, 6.6.17.1#1, 6.6.17.1#2, 6.11.2.1.1.1#1, 6.11.2.1.2.1.2#1, 6.11.2.1.2.2#1, 6.11.2.1.2.3#1, 6.11.2.1.2.3#3, 6.11.2.1.2.4#1, 6.11.2.1.2.4#2, 6.11.2.1.2.5#2, 8.3.3.5.2.3#1, 8.3.3.5.2.3#2, 8.3.3.5.2.3#3, 8.3.3.12.2.1#1, 8.3.3.12.2.1#2

Description:
As Provider (DFP), the Tester verifies that the UUT receives a chunked extended message correctly by sending messages to request chunks.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported set to 0 in Source_Capabilities message during this process.

b) The Tester sends the first chunk of a chunked extended message to the UUT, with Data Size set to 260 and Message Type set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

c) If a message is not received within tChunkingNotSupported max, this test fails. The delay is measured from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

d) If the received message is Not_Supported, the Tester verifies the message is received after tChunkingNotSupported min and stops here.

e) If the message is not received within tChunkReceiverRequest max, the test fails.

f) Upon receipt of the response from the UUT, the Tester verifies the following:

1. For Message Header
   - Extended = 1
   - Number of Data Objects = 1
   - Port Power Role field = 0b (Sink)
   - Port Data Role field = 0b (UFP)
   - Specification Revision = 10b (Rev 3.0)
   - Message Type = 11111b

2. For Extended Message Header
   - Chunked = 1
   - Chunk Number = next chunk in the series
   - Request Chunk = 1
   - Bit 9 = 0 (Reserved)
Power Delivery 3.0 Tests

- **Data Size** = 0
  
g) The Tester sends the requested chunk to the UUT.
h) Repeat e) and g) until the Tester has finished sending all 10 chunks.

TD. PD. SNK3. E12. Soft_Reset sent regardless of Rp value

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.8.1#7

Description:

As Provider (DFP), the Tester forces the UUT to send Soft_Reset and verifies Soft_Reset is sent regardless even though the Rp value is SinkTxNG.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester keeps the Rp value as SinkTXNG and sends a Get_Sink_Cap message to the UUT.
c) Upon receipt of the SinkCapabilities Message, the Tester doesn’t reply with GoodCRC.
d) The Tester verifies that a Soft_Reset message is sent by the UUT within \( t_{Receive} \) max + \( t_{SoftReset} \) max, the delay is measured from the time the last bit of the last retransmitted SinkCapabilities Message EOP has been received to the time the last bit of the Soft_Reset message EOP has been received.

TD. PD. SNK3. E13. SinkPPSPeriodicTimer Timeout

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.4.1.2#9, 6.6.18.1#1, 6.6.18.1#2, 6.6.18.1#3, 8.3.3.3.7#4

Description:

As Provider (DFP), the Tester verifies the UUT periodically re-request the PPS APDO at least every \( t_{PPSRequest} \).

Steps:

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role.
b) The Tester sets termination to \texttt{SinkTxOk}.

c) If a \textit{Request} message is not received within \texttt{tPPSRequest max}, the test fails. The delay is measured from the time the last bit of the \texttt{EOP} of the \textit{GoodCRC} Message sent by the Tester in response to the previous \textit{Request} Message to the time the first bit of the \textit{Preamble} of the new \textit{Request} Message is received.

**TD. PD. SNK3. E14. Request Fields Checks - PPS**

**Applicable to:**

- UUT: Consumer Only, Consumer / Provider, Dual-role Port
- UUTs which requests a PPS APDO

**Assertions Tested:**

6.4.2.7#6, 6.4.2.13#1, 6.4.2.13#2, 6.4.2.13#3

**Description:**

As Provider, the Tester waits for a \textit{Request} message from the UUT, which requests a PPS APDO, and verifies correct field values.

**Steps:**

a) Run PROC.PD.E2 Bring-up procedure for PPS Tests according to the UUT role, but stops after a Request for APDO is received or times out.

b) Upon receipt of the \textit{Request} message, the Tester verifies:

1. \textit{Number of Data Objects} field = 001b
2. \textit{MessageID} field = 000b
3. \textit{Port Power Role} field = 0b (Sink)
4. \textit{Port Data Role} field = 0b (UFP)
5. \textit{Specification Revision} field = 10b (Rev 3.0)
6. \textit{Extended} Field = 0b

c) For the Sink Request Data Object, the Tester verifies:

1. \textit{Object Position} field is 2.
2. The \textit{Operating Current} is less than or equal to the maximum current offered in the \textit{Source Capabilities} Message.
3. The \textit{Output Voltage} field Shall be greater than or equal to the Minimum Voltage field and less than or equal to the Maximum Voltage field in the Programmable Power Supply APDO.
4. Bit 31 = 0b (Reserved)
5. Bit 27 = 0b (Reserved)
6. Bits 22..20 = 000b (Reserved)
7. Bits 8..7 = 00b (Reserved)
**TD. PD. SNK3. E15. Status Fields Checks**

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.2#3, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.2#1, 6.5.2#4, 6.5.2.4#2, 6.5.2.5#1

Description:

As Provider (DFP), the Tester sends a *Get_Status* message to the UUT, waits for a *Status* message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in *Source_Capabilities* message during this process.
b) The Tester sends a *Get_Status* message to the UUT.
c) If a *Not_Supported* message is received, the test passes and stops here.
d) Upon receipt of the *Status* message, the Tester verifies:

1. *Port Power Role field = 0b (Sink)*
2. *Specification Revision* field = 10b (Rev 3.0)
3. *Port Data Role field = 0b (UFP)*
4. *Extended* = 1b
5. *Chunk Number* in Extended Message Header = 0
6. *Request Chunk* in Extended Message Header = 0
7. Bit 9 (*Reserved*) in Extended Message Header = 0
8. *Data Size* in Extended Message Header = 6
9. If both the UUT and the Tester support unchunked extended messages
   - *Chunked* bit in Extended Message Header = 0
   - *Number of Data Objects* field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
    - *Chunked* bit in Extended Message Header = 1
    - *Number of Data Objects* field = 2
    - The total number of data bytes is consistent with the *Number of Data Objects* field
    - The last 1 byte of the 2nd Data Object has zero value if *Data Size* (in Extended Message Header) = 5
11. For the SDB
   - Bit 0 of Present Input field = 0
   - Bits 5..7 of Present Input field are 0
   - If bit 3 of Present Input field is 0, Present Battery Input field shall be 0
   - Bit 0 and Bits 5..7 of Event Flags field are 0
   - OVT Event is not set in Event Flags field
   - Bit 0, Bits 3..7 of Temperature Status field are 0
   - Bit 0, Bits 6..7 of Power Status field are 0
   - If OTP event is set in Event Flags, Temperature Status shall be Over temperature. And vice versa.

   e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

TD. PD. SNK3. E16. Manufacturer_Info Fields Checks

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

- 6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1

Description:

As Provider (DFP), the Tester sends a Get_Manufacturer_Info message to the UUT, wait for a Manufacturer_Info message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in Source_Capabilities message during this process.

b) The Tester sends a Get_Manufacturer_Info message, in which Manufacturer Info Target is set to 0, to the UUT.

c) If a Not_Supported message is received, the test passes and stops here.

d) Upon receipt of the Manufacturer_Info message, the Tester verifies:

1. Port Power Role field = 0b (Sink)
2. Specification Revision field = 10b (Rev 3.0)
3. Port Data Role field = 0b (UFP)
4. Extended = 1b
5. Chunk Number in Extended Message Header = 0
6. Request Chunk in Extended Message Header = 0
7. Bit 9 *(Reserved)* in Extended Message Header = 0
8. **Data Size** in Extended Message Header is between 5 and 26
9. If both the UUT and the Tester support unchunked extended messages
   - **Chunked** bit in Extended Message Header = 0
   - **Number of Data Objects** field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
   - **Chunked** bit in Extended Message Header = 1
   - **Number of Data Objects** field = (Data Size + 5) / 4
   - The Packet payload is padded to the next 4-byte Data Object boundary with zeros (0x00).
     e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SNK3. E17. Manufacturer_Info Fields Checks - Invalid Manufacturer Info Target**

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.1#4, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.7#2, 6.5.7.3#2

Description:

As Provider (DFP), the Tester sends a **Get_Manufacturer_Info** message, in which Manufacturer Info Target is set to 2, to the UUT, wait for a **Manufacturer_Info** message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in *Source_Capabilities* message during this process.
b) The Tester sends a **Get_Manufacturer_Info** message, in which **Manufacturer Info Target** is set to 2, to the UUT.
c) If a **Not_Supported** message is received, the test passes and stops here.
d) Upon receipt of the **Manufacturer_Info** message, the Tester verifies:
   1. **Port Power Role field** = 0b *(Sink)*
   2. **Specification Revision** field = 10b *(Rev 3.0)*
   3. **Port Data Role field** = 0b *(UFP)*
   4. **Extended** = 1b
   5. **Chunk Number** in Extended Message Header = 0
6. **Request Chunk** in Extended Message Header = 0
7. Bit 9 (**Reserved**) in Extended Message Header = 0
8. **Data Size** in Extended Message Header is 18 (PID + VID + “Not Supported” + null)
9. If both the UUT and the Tester support unchunked extended messages
   - **Chunked** bit in Extended Message Header = 0
   - **Number of Data Objects** field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
   - **Chunked** bit in Extended Message Header = 1
   - **Number of Data Objects** field = 5
   - The total number of data bytes is consistent with the **Number of Data Objects** field
11. **Manufacturer String** in Manufacturer Info Data Block = null terminated ASCII text string “Not Supported”
e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SNK3. E18. Manufacturer Info Fields Checks - Invalid Manufacturer Info Ref**

**Applicable to:**
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

**Assertions Tested:**

6.2.1.1.1#1, 6.2.1.1.1#2, 6.2.1.1.2#4, 6.2.1.1.2#5, 6.2.1.1.2#6, 6.2.1.1.2#7, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#2, 6.2.1.2#3, 6.2.1.2#6, 6.2.1.2#7, 6.2.1.2#8, 6.2.1.2#9, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#4, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.1#8, 6.2.1.2.1#9, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#2, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.7#2, 6.5.7.3#2

**Description:**

As Provider (DFP), the Tester sends a **Get_Manufacturer_Info** message with an invalid **Manufacturer Info Ref** to the UUT, waits for a **Manufacturer_Info** message from the UUT, and verifies correct field values.

**Steps:**

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported to 1 in **Source_Capabilities** message during this process.

b) The Tester sends a **Get_Manufacturer_Info** message, in which **Manufacturer Info Target** is set to 1 and **Manufacturer Info Ref** is set to 8, to the UUT.

c) If a **Not_Supported** message is received, the test passes and stops here.

d) Upon receipt of the **Manufacturer_Info** message, the Tester verifies:
   1. **Port Power Role field** = 0b (Sink)
   2. **Specification Revision** field = 10b (Rev 3.0)
3. *Port Data Role field = 0b (UFP)*
4. *Extended = 1b*
5. *Chunk Number* in Extended Message Header = 0
6. *Request Chunk* in Extended Message Header = 0
7. Bit 9 *(Reserved)* in Extended Message Header = 0
8. *Data Size* in Extended Message Header is 18 (PID + VID + “Not Supported” + null)
9. If both the UUT and the Tester support unchunked extended messages
   - *Chunked* bit in Extended Message Header = 0
   - *Number of Data Objects* field = 000b
10. If either the UUT or the Tester doesn’t support unchunked extended messages
    - *Chunked* bit in Extended Message Header = 1
    - *Number of Data Objects* field = 5
    - The total number of data bytes is consistent with the *Number of Data Objects* field
11. *Manufacturer String* in Manufacturer Info Data Block = null terminated ASCII text string “Not Supported”
    e) Rerun the test, with Unchunked Extended Messages Supported set to 0 in step a)

**TD. PD. SNK3. E19. ChunkSenderResponseTimer Timeout**

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

6.6.17.3#1, 6.6.17.3#2, 6.6.17.3#5, 6.11.2.1.2.5#1, 6.11.2.1.2.5#3, 6.11.2.1.2.6#4

Description:

As Provider (DFP), the Tester verifies that the UUT recovers correctly after the Tester stops sending chunked messages in the middle.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role. The Tester sets Unchunked Extended Messages Supported set to 0 in *Source_Capabilities* message during this process.

b) The Tester sends the first chunk of a chunked extended message to the UUT, with *Data Size* set to 260 and *Message Type* set to 1111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

c) If a message is not received within *tChunkingNotSupported* max, this test fails. The delay is messaged from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.
d) If the received message is Not_Supported, the Tester verifies the message is received after tChunkingNotSupported min and stops here.

e) If the message is not received within tChunkReceiverRequest max, the test fails.

f) Upon receipt of the message from the UUT to request for the next chunk, the Tester sends the requested chunk to the UUT.

g) Repeat f) until the Tester has finished sending 4 chunks and intentionally does not send the 5th chunk to the UUT.

h) The Tester waits for tChunkSenderResponse max + 5 ms, and sends the first chunk to the UUT.

i) If a message is not received within tChunkReceiverRequest max, the test fails.

j) Upon receipt of the message, the Tester verifies the following:

1. For Message Header
   - Extended = 1
   - Number of Data Objects = 1
   - Port Power Role field = 0b (Sink)
   - Port Data Role field = 0b (UFP)
   - Specification Revision = 10b (Rev 3.0)
   - Message Type = 11111b

2. For Extended Message Header
   - Chunked = 1
   - Chunk Number = 1
   - Request Chunk = 1
   - Bit 9 = 0 (Reserved)
   - Data Size = 0

3. The total number of data bytes is consistent with the Number of Data Objects field

4. The last 2 bytes of the Data Object are 0
Cable Tests

TD.PD.CBL3.E1. Receiving Chunked Extended Message

Applicable to:

- UUT: Cable

Assertions Tested:

6.5.7#1, 8.3.3.12.2.1#1, 8.3.3.12.2.1#2

Description:

As Provider (DFP), the Tester verifies that the UUT receives a chunked extended message correctly by sending messages to request chunks.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends the first chunk of a chunked extended message to the UUT, with Data Size set to 260 and Message Type set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

c) If a message is not received within tChunkReceiverRequest max, this test passes and stops here (in case of the first chunk) or failed (for other chunks). The delay is measured from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

d) Upon receipt of the message from the UUT, the Tester verifies the following:

1. For Message Header
   - Extended = 1
   - Number of Data Objects = 1
   - Cable Plug = 1b (From Cable Plug)
   - Bit 5 = 0 (Reserved)
   - Specification Revision = 10b (Rev 3.0)
   - Message Type = 11111b

2. For Extended Message Header
   - Chunked = 1
   - Chunk Number = the next chunk in the series
   - Request Chunk = 1
   - Bit 9 = 0 (Reserved)
   - Data Size = 0

e) The Tester sends the requested chunk to the UUT.

f) Repeat c) to e) until the Tester has finished sending all 10 chunks.
TD.PD.CBL3.E2. ChunkSenderResponseTimer Timeout

Applicable to:
- UUT: Cable

Assertions Tested:
6.6.17.3#1, 6.6.17.3#2, 6.6.17.3#5, 6.11.2.1.2.5#1, 6.11.2.1.2.5#3, 6.11.2.1.2.6#4

Description:
As Provider (DFP), the Tester verifies that the UUT recovers correctly after the Tester stops sending chunked messages in the middle.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends the first chunk of a chunked extended message to the UUT, with Data Size set to 260 and Message Type set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

c) If a message is not received within tChunkReceiverRequest max, this test passes and stops here. The delay is messaged from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

d) Upon receipt of the message from the UUT to request for the next chunk, the Tester sends the requested chunk to the UUT.

e) Repeat d) until the Tester has finished sending 4 chunks and intentionally does not send the 5th chunk to the UUT.

f) The Tester waits for tChunkSenderResponse max + 5 ms, and sends the first chunk to the UUT.

g) If a message is not received within tChunkReceiverRequest max, the test fails.

h) Upon receipt of the message, the Tester verifies the following:
   
   1. For Message Header
      - Extended = 1
      - Number of Data Objects = 1
      - Cable Plug = 1b (From Cable Plug)
      - Bit 5 = 0 (Reserved)
      - Specification Revision = 10b (Rev 3.0)
      - Message Type = 11111b

   2. For Extended Message Header
      - Chunked = 1
      - Chunk Number = 1
      - Request Chunk = 1
      - Bit 9 = 0 (Reserved)
Power Delivery 3.0 Tests

– Data Size = 0

3. The total number of data bytes is consistent with the Number of Data Objects field

4. The last 2 bytes of the Data Object are 0

TD.PD.CBL3.E3. Manufacturer_Info Fields Checks

Applicable to:

- UUT: Cable

Assertions Tested:

6.2.1.1.1#1, 6.2.1.1.2#3, 6.2.1.1.2#4, 6.2.1.1.5#8, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1

Description:

As Provider (DFP), the Tester sends a Get_Manufacturer_Info message to the UUT, wait for a Manufacturer_Info message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends a Get_Manufacturer_Info message, in which Manufacturer Info Target is set to 0, to the UUT.

c) If a message is not received within tReceiverResponse max, the test passes and stops here. The delay is measured from the time the last bit of the EOP of the Get_Manufacturer_Info message has been transmitted until the first bit of the response Message Preamble has been received.

d) If the received message is not Manufacturer_Info message, the Tester reports an error.

e) Upon receipt of the Manufacturer_Info message, the Tester verifies:

1. Cable Plug field = 1b (From Cable Plug)
2. Specification Revision field = 10b (Rev 3.0)
3. Bit 5 = 0 (Reserved)
4. Extended = 1b
5. Chunk Number in Extended Message Header = 0
6. Request Chunk in Extended Message Header = 0
7. Bit 9 (Reserved) in Extended Message Header = 0
8. Data Size in Extended Message Header is is between 5 and 26
9. Chunked bit in Extended Message Header = 1
10. Number of Data Objects field = (Data Size + 5) / 4
11. The Packet payload is padded to the next 4-byte Data Object boundary with zeros (0x00).
TD.PD.CBL3.E4. Manufacturer_Info Fields Checks - Invalid Manufacturer Info Target

Applicable to:
- UUT: Cable

Assertions Tested:
6.2.1.1.1#1, 6.2.1.1.2#3, 6.2.1.1.5#8, 6.2.1.1.8#1, 6.2.1.2#1, 6.2.1.2#3, 6.2.1.2.1#1, 6.2.1.2.1#2, 6.2.1.2.1#6, 6.2.1.2.1#7, 6.2.1.2.2#1, 6.2.1.2.2#2, 6.2.1.2.3#1, 6.2.1.2.3#3, 6.2.1.2.4#1, 6.2.1.2.4#3, 6.5#1, 6.5.7#2, 6.5.7.3#2

Description:
As Provider (DFP), the Tester sends a Get_Manufacturer_Info message, in which Manufacturer Info Target is set to 2, to the UUT, wait for a Manufacturer_Info message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) The Tester sends a Get_Manufacturer_Info message, in which Manufacturer Info Target is set to 2, to the UUT.
c) If a message is not received within tReceiverResponse max, the test passes and stops here. The delay is measured from the time the last bit of the EOP of the Get_Manufacturer_Info message has been transmitted until the first bit of the response Message Preamble has been received.
d) If the received message is not Manufacturer_Info message, the Tester reports an error.
e) Upon receipt of the Manufacturer_Info message, the Tester verifies:

1. Cable Plug field = 1b (From Cable Plug)
2. Specification Revision field = 10b (Rev 3.0)
3. Bit 5 = 0 (Reserved)
4. Extended = 1b
5. Chunk Number in Extended Message Header = 0
6. Request Chunk in Extended Message Header = 0
7. Bit 9 (Reserved) in Extended Message Header = 0
8. Data Size in Extended Message Header is 18 (PID + VID + “Not Supported” + null)
9. Chunked bit in Extended Message Header = 1
10. Number of Data Objects field = 5
11. The total number of data bytes is consistent with the Number of Data Objects field
12. Manufacturer String in Manufacturer Info Data Block = null terminated ASCII text string “Not Supported”
TD.PD.CBL3.E5. Unrecognized Message Received

Applicable to:
- UUT: Cable

Assertions Tested:
- 6.5.7#1, 8.3.3.12.2.1#1, 8.3.3.12.2.1#2

Description:
As Provider (DFP), the Tester verifies that the UUT ignores an unrecognized message.

Steps:
- a) Run PROC.PD.E1 Bring-up according to the UUT role.
- b) The Tester sends the first chunk of a chunked extended message to the UUT, with Data Size set to 26 and Message Type set to 11111b. Bytes 0 to 25 of data block contain incrementing values starting at 0x00.
- c) If a message is received within tChunkReceiverRequest max, the test fails. The delay is measured from the time the last bit of the EOP of the chunk message has been transmitted until the first bit of the response Message Preamble has been received.

Applicable to:
- UUT: Cable

Assertions Tested:
- 6.2.1.1.5#13, 6.2.1.1.5#14

Description:
As Provider (DFP), the Tester verifies that the UUT doesn’t save the agreed Specification Revision and always respond with the highest Specification Revision it supports that is equal to or lower than the Specification Revision contained in the Message received.

Steps:
- a) Run PROC.PD.E1 Bring-up according to the UUT role.
- b) The Tester sends a Discover Identity message, with specification revision set to 10b (Rev 3), to the UUT.
- c) If the specification revision is 01b (Rev 2) in the Discover Identity ACK message, this test passes and stops here.
- d) The Tester sends a GoodCRC message to the UUT.
Power Delivery 3.0 Tests

e) The Tester sends a Discover SVIDs message, with specification revision set to 01b (Rev 2), to the UUT.
f) The Tester verifies the specification revision in the responded message is also set to 01b.

TD.PD.CBL3.E7. Status sent timely

Applicable to:
- UUT: Cable

Assertions Tested:

Description:

As Provider (DFP), the Tester verifies that the UUT replies Get_Status message with a Status message timely.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) If the Product Type (Cable Plug) in the returned Discovery Identity ACK message is not Active Cable, the test passes and stops here.
c) The Tester sends a Get_Status message to the UUT.
d) If a Status message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of Get_Status message EOP has been transmitted to the time the first bit of the Status message preamble has been received.

TD.PD.CBL3.E8. Status Fields Checks

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:

Description:

As Provider (DFP), the Tester sends a Get_Status message to the UUT, waits for a Status message from the UUT and verifies correct field values.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.
b) If the Product Type (Cable Plug) in the returned Discovery Identity ACK message is not Active Cable, the test passes and stops here.
c) The Tester sends a Get_Status message to the UUT.
d) Upon receipt of the Status message, the Tester verifies:
1. **Cable Plug** field = 1b (From Cable Plug)
2. **Specification Revision** field = 10b (Rev 3.0)
3. **Bit 5** = 0 (Reserved)
4. **Extended** = 1b
5. **Chunk Number** in Extended Message Header = 0
6. **Request Chunk** in Extended Message Header = 0
7. **Bit 9 (Reserved)** in Extended Message Header = 0
8. **Data Size** in Extended Message Header is 2
9. **Chunked** bit in Extended Message Header = 1
10. **Number of Data Objects** field = 1
11. For the SDB
    - Internal Temp shall be less than the Shutdown Temperature reported in Active Cable VDO2
    - Bit 0 of the Flags field is 0 (Thermal Shutdown cleared)
    - Bits 1..7 of the Flags field are 0 (Reserved)
VDM Tests

TD. PD. VDM3. E1. Fields Checks - Discover Identity

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port, Provider / Consumer, Provider Only, Cable

Assertions Tested:

6.2.1.1.5#8, 6.4.4.2#10, 6.4.4.2.3#4, 6.4.4.3.1.1.6#2, 6.4.4.3.1.4.1#3, 6.4.4.3.1.4.1#4, 6.4.4.3.1.4.1#5, 6.4.4.3.1.4.2#3, 6.4.4.3.1.4.2#4, 6.4.4.3.1.4.2#5, 6.12.4#2

Description:

This test verifies that the UUT responds a well-formed message to a Discover Identity.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends Discover Identity.

c) The test passes and stops here if the UUT is not a cable and a Not_Supported message is received.

d) Wait for the Discover Identity Response and verify the following:

1. For VDM Header (VDO #1)
   - SVID = 0xFF00 (PD SID)
   - VDM Type = 1b (Structured VDM)
   - Structured VDM Version = 01b (Version 2.0)
   - Bits 12-11 are 0 (reserved).
   - Object Position = 000b
   - Command Type = 01b (ACK) if the UUT is a Cable and Command Type != 00b (REQ) otherwise
   - Bit 5 is 0 (reserved).
   - Command = 0001b (Discover Identity).

2. If the Command Type in VDM Header is not 01b (ACK), the test verifies Number of Data Objects is 1 and stops here.

3. For ID Header (VDO #2)
   - Product Type(UFP) or Product Type(Cable Plug) and Product Type (DFP) are not Reserved
   - Bits 22..16 are 0 (reserved)

4. If Product Type is Passive Cable, for Passive Cable VDO (VDO #5)
Power Delivery 3.0 Tests

- VDO Version field is 000b (Version 1.0)
- USB Type-C plug to USB TypeC/Captive field is 10b (USB Type-C) or 11b (Captive)
- Bit 20 is 0 (Reserved)
- Bit 17 is 0 (Reserved)
- Bits 8..7 are 0 (Reserved)
- Bits 4..3 are 0 (Reserved)

5. If Product Type is Active Cable
   - For Active Cable VDO 1 (VDO #5)
     - VDO Version field is 010b (Version 1.2)
     - USB Type-C plug to USB TypeC/Captive field is 10b (USB Type-C) or 11b (Captive)
     - Bit 20 is 0 (Reserved)
     - Bit 17 is 0 (Reserved)
   - For Active Cable VDO 2 (VDO #6)
     - Bits 15..6 are 0 (Reserved)
     - Bit 2 is 0 (Reserved)
     - SuperSpeed Signaling field shall be 00b (Gen1) or 01b (Gen2)

6. If Product Type is Alternate Mode Adapter, for AMA VDO (VDO #5)
   - VDO Version field is 000b (Version 1.0)
   - Bits 20..8 are 0 (Reserved)

   e) The test fails if any of these checks are invalid.
   f) The test fails if the Product Type declared in the ID Header (VDO #2) is Hub (1), Peripheral (2) or Power Brick(3) and the Number of Data Objects is not exactly 4.
   g) The test fails if the Product Type declared in the ID Header (VDO #2) is Passive Cable (3), or AMA (5) and the Number of Data Objects is not exactly 5.
   h) The test fails if the Product Type declared in the ID Header (VDO #2) is Active Cable (4) and the Number of Data Objects is not exactly 6.

TD. PD. VDM3. E2. Unrecognized VID in Unstructured VDM

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
6.4.4.1#9

Description:
As a DFP, the Tester verifies that the UUT responds a Not_Supported message to an unstructured VDM message with an unrecognized VID.
Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester sends an unstructured VMD message to the UUT, in which VID in the Unstructured VDM Header is set to the Tester manufacture’s VID.

c) If a Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of unstructured VMD message EOP has been transmitted to the time the first bit of the Not_Supported message preamble has been received.
Fast Role Swap Tests – Initial Source

TD.PD.FRSISRC3.E1. Normal Conditions

Applicable to:
- UUT: Provider/Consumer, Dual-role Port

Assertions Tested:
5.8.5.6#1, 5.8.5.6#4, 6.2.1.1.4#6, 6.3.3#5, 6.3.17#2, 6.3.17#7, 6.6.5.2.2#1, 6.12.1#8, 8.3.3.16.5.5#1

Description:
As an initial Sink, the Tester verifies that the UUT does Fast Role Swap correctly under normal conditions.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Source.
b) The Tester operates the appropriate power disconnection (see Appendix A). The Tester verifies the following:
   - If Fast Role Swap USB Type-C Current field is 00b (in the SinkCapabilities message), check that no Fast Role Swap signal is received and the test ends here.
   - If Fast Role Swap USB Type-C Current field is not 00b (in the SinkCapabilities message), check that Fast Role Swap signal is received within 60 seconds after power disconnection. Also, check that the Fast Role Swap signal meets tFRSwapTx

c) After receiving the Fast Role Swap signal, the VBUS electrical and PD messaging test sub-steps are performed separately. In the following sub-steps, the sequences of the VBUS electrical behavior and PD messaging are only bounded at the operating point referred to as Stage 1.
   - VBUS electrical sub-steps:
     1. The Tester immediately stops sinking current through VBUS after receiving Fast Role Swap signal
     2. The Tester waits for VBUS to be below vSafe5V max and this operating point is referred to as Stage 1
     3. The Tester applies vSafe5V on VBUS at tSrcFRSwap max after receiving Fast Role Swap signal and VBUS has dropped below vSafe5V min. After the start of Fast Role Swap signal, the Tester verifies that the UUT does not draw more than pSnkStdby, either while VBUS is below vSafe5V (min) until VBUS is recovered above vSafe5V (min) or tSnkFRSwap has elapsed, whichever comes first.
     4. After tSnkFRSwap, check that the UUT does not draw more current than it declared it would.
   - PD messaging sub-steps:
     1) The Tester checks that the UUT presents SinkTxOK within 1 millisecond after receiving Fast Role Swap signal.
2) The Tester sends **FR_Swap** message at **tFRSwapInit** max after receiving Fast Role Swap signal. If the Tester cannot send the **FR_Swap** message because it cannot start an AMS, the test fails.

3) Upon receipt of the Accept message, the Tester verifies the Port Power Role field = 1b (Source) and replies with a **GoodCRC** message. If the Tester does not receive the **Accept** message within **tReceiverResponse** max from the last bit of the **EOP** of the **FR_Swap** message, the test fails.

4) When the operating point has reached **Stage 1** and the UUT has received the **Accept** message, the Tester verifies that the UUT presents Rd, and then sending **PS_RDY** message within **tFRSwap5V** of the last bit of the **EOP** of **Accept** message. In addition, the Tester verifies the Port Power Role field = 0b (Sink) in the **PS_RDY** message.

5) At 1 millisecond prior to **tFRSwapComplete** (i.e. **tFRSwapComplete** minus 1 millisecond) after receiving **PS_RDY** message, the Tester changes from presenting Rd to Rp. The Rp value the Tester presents shall match FR_Swap_Reqd_Type_C_Current_As_Initial_Source parameter as specified in the VIF.

6) The Tester sends **PS_RDY** message at 1 millisecond prior to **tFRSwapComplete** (i.e. **tFRSwapComplete** minus 1 millisecond) after receiving **PS_RDY** message from the UUT.

7) As a new Source, the Tester checks whether it can successfully run PROC.PD.E4 bring-up procedures. The Tester sends **SourceCapabilities** message that matches the UUT sink requirements after **tSwapSourceStart** min.

   d) The Tester runs the test again, but in step a) the Tester requests for highest voltage in the **SourceCapabilities** message (in lieu of establishing a contract at **vSafe5V**).

**TD.PD.FRSISRC3.E2. Test Removed**

This test is removed.

**TD.PD.FRSISRC3.E3. Accept Not Sent**

Applicable to:

- UUT: Provider / Consumer, Dual-role Port

Assertions Tested:

8.3.3.16.5.4#3

Description:

Initially as Consumer (UFP), after the receipt of the **Accept** message for **FR_Swap**, the Tester intentionally does not reply **GoodCRC** in order to force a **Hard Reset** on the UUT and verifies it is correctly implemented.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Source.
b) The Tester operates the appropriate power disconnection (see Appendix A). If the Fast Swap Signal is not detected within 60 second time period, the test passes and stops here.

c) The Tester sends a FR_Swap message. If the Tester cannot send the FR_Swap message because it cannot start an AMS, the test fails.

d) Upon receipt of the Accept message, the Tester intentionally does not reply with a GoodCRC message.

e) After nRetryCount retries the Accept message, the test fails if Hard Reset is not detected within tReceive max + tProtErrHardReset max, the delay is measured from the time the last bit of the last retransmitted Accept Message EOP has been received to the time the first bit of the Hard Reset is received.

TD.PD.FRSISRC3.E4. PS_RDY Not Sent

Applicable to:
- UUT: Provider / Consumer, Dual-role Port

Assertions Tested:

8.3.3.16.5.7#4

Description:

Initially as Consumer (UFP), after the receipt of the PS_RDY message during the Fast Role Swap process, the Tester intentionally does not reply GoodCRC in order to force an Error Recovery on the UUT and verifies it is correctly implemented.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Source.

b) The Tester operates the appropriate power disconnection (see Appendix A). If the Fast Swap Signal is not detected within 60 second time period, the test passes and stops here.

c) The Tester sends a FR_Swap message. If the Tester cannot send the FR_Swap message because it cannot start an AMS, the test fails.

d) Upon receipt of the Accept message, the Tester replies with a GoodCRC message.

e) The test fails if PS_RDY is not received within tPSSourceOff min. The delay is measured from the time the last bit of the EOP of the GoodCRC message sent by the Tester in response to the Accept message to the time the last bit of the EOP of the PS_RDY message is received.

f) Upon receipt of the PS_RDY message, the Tester intentionally does not reply with a GoodCRC message.

g) After nRetryCount retries the PS_RDY message, the test fails if Error Recovery is not detected within tReceive max + tProtErrHardReset max, the delay is measured from the time the last bit of the last retransmitted PS_RDY Message EOP has been received to the time the Error Recovery is detected.
TD.PD.FRSISRC3.E5. PSSourceOnTimer Deadline

Applicable to:
- UUT: Provider / Consumer, Dual-role Port

Assertions Tested:
6.6.5.3.2#1, 6.6.5.3.2#2, 8.3.3.16.5.7#1, 8.3.3.16.5.7#2

Description:
Initially as Consumer (UFP), after a FR_Swap accepted, the Tester sends PS_RDY at the deadline limit of tPSSourceOn min and verifies the UUT accepts this message.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Source.
b) The Tester operates the appropriate power disconnection (see Appendix A). If the Fast Swap Signal is not detected within 60 second time period, the test passes and stops here.
c) The Tester sends a FR_Swap message. If the Tester cannot send the FR_Swap message because it cannot start an AMS, the test fails.
d) Upon receipt of the Accept message, the Tester replies with a GoodCRC message.
e) Upon receipt of the PS_RDY message, the Tester replies with a GoodCRC message.
f) The Tester sends a PS_RDY at the deadline limit of tPSSourceOn min after the time the last bit of the EOP of the GoodCRC message corresponding to the received PS_RDY message was sent.
g) The test passes if a GoodCRC is received.
h) The test fails if Error Recovery is detected when waiting the GoodCRC message or before sending the PS_RDY.

TD.PD.FRSISRC3.E6. PSSourceOnTimer Timeout

Applicable to:
- UUT: Provider / Consumer, Dual-role Port

Assertions Tested:
8.3.3.16.5.7#4

Description:
Initially as Consumer (UFP), after a FR_Swap accepted, the Tester intentionally does not send PS_RDY, in order to force a PSSourceOnTimer timeout on the UUT and verifies it is correctly implemented.
Steps:

a) Run PROC.PD.E4 with the UUT as an initial Source.

b) The Tester operates the appropriate power disconnection (see Appendix A). If the Fast Swap Signal is not detected within 60 second time period, the test passes and stops here.

c) The Tester sends a FR_Swap message. If the Tester cannot send the FR_Swap message because it cannot start an AMS, the test fails.

d) Upon receipt of the Accept message, the Tester replies with a GoodCRC message.

e) Upon receipt of the PS_RDY message, the Tester replies with a GoodCRC message.

f) The Tester intentionally does not send PS_RDY, in order to force a PSSourceOnTimer timeout on the UUT.

g) If Error Recovery is detected within \( t_{PSSourceOn} \) min after the time the last bit of the EOP of the GoodCRC message corresponding to the received PS_RDY message was sent, the test fails.

h) If Error Recovery is not detected after \( t_{PSSourceOn} \) max after the time the last bit of the EOP of the GoodCRC message corresponding to the received PS_RDY message was sent, the test fails.
Fast Role Swap Tests – Initial Sink

TD.PD.FRSISNK3.E1. Normal Conditions

Applicable to:
- UUT: Provider/Consumer, Dual-role Port

Assertions Tested:
- 5.8.6.3#4, 5.8.6.3#5, 6.2.1.1.4#7, 6.3.17#1, 6.3.17#7, 6.4.1.3.1.6#2, 6.6.3.3#1, 6.6.16#1

Description:
As an initial Source, the Tester verifies that the UUT does Fast Role Swap correctly under normal conditions.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Sink.
b) The Tester sends a Fast Role Swap signal to the UUT, with a duration of tFRSwapTx min.
c) If the VIF parameter FR_Swap_Supported_As_Initial_Sink is NO, and an FR_Swap message is received, or the UUT provides vSafe5V over Vbus, then the test ends in fail. Otherwise, the Tester proceeds to the next step.
d) After sending the Fast Role Swap signal, the Vbus electrical and PD messaging test sub-steps are performed separately.

- Vbus electrical sub-steps:
  1. The Tester immediately turns off the Vbus at the end of Fast Role Swap signal. The Tester as a Source shall be equipped with a capacitance of 10uF on the Vbus.
  2. The Tester draws no current until tSnkFRSwap has passed, since the start of the Fast Role Swap signal or since when the Vbus falls below vSafe5V min, whichever comes later. After that, the Tester draws the current it announced it would. After the Tester turning off the Vbus, the operating point when Vbus is below vSafe5V max is referred to as Stage 1.
  3. The Tester verifies that the UUT as a new Source supplies Vbus and it reaches vSafe5V min within tSrcFRSwap of both the Fast Role Swap signal having had time to be detected, and Vbus being below vSafe5V min (due to Tester turning off Vbus).

- PD messaging sub-steps:
  1) The Tester presents SinkTxOK immediately after sending Fast Role Swap signal.
  2) The Tester checks that FR_Swap message starts to be sent by the UUT within tFRSwapRx max plus tFRSwapInit max of the start of the Fast Role Swap signal.
  3) The Tester sends an Accept message at the boundary of tReceiverResponse max from the last bit of the EOP of the FR_Swap message.
  4) The Tester changes from presenting Rp to Rd as soon as the operating point has reached Stage 1.
The Tester sends **PS_RDY** message immediately after changing from presenting Rp to Rd (in sub-step 4).

The Tester checks that UUT changes from presenting Rd to Rp within **tFRSwapComplete** of having sent **PS_RDY** message (in sub-step 5).

The Tester checks that it starts receiving **PS_RDY** message from the UUT within **tFRSwapComplete** of having sent **PS_RDY** message (in sub-step 5).

As a new Sink, the Tester checks whether it can successfully run PROC.PD.E1 bring-up procedures by requesting PDO 5V. The Tester verifies that the UUT sends a **SourceCapabilities** message after **tSwapSourceStart** min, but before **tFirstSourceCap** max.

The Tester runs the test again, but in step a) the Tester sends **SourceCapabilities** message with Fixed Supply PDO 5V at 0A plus a Fixed Supply PDO with the highest voltage in the UUT’s **SinkCapabilities** message at the corresponding current. This would result in establishing contract at the highest voltage in the UUT’s **SinkCapabilities** message (in lieu of establishing a contract at **vSafe5V**).

**TD.PD.FRSISNK3.E2. FR_Swap Not Sent**

**Applicable to:**

- UUT: Consumer / Provider, Dual-role Port

**Assertions Tested:**

8.3.3.16.6.2#3

**Description:**

Initially as Provider (DFP), after the receipt of the **FR_Swap** message, the Tester intentionally does not reply **GoodCRC** in order to force an **Error Recovery** on the UUT and verifies it is correctly implemented.

**Steps:**

a) Run PROC.PD.E4 with the UUT as an initial Sink.

b) The Tester sends a Fast Role Swap signal to the UUT, with a duration of **tFRSwapTx** min.

c) Upon receipt of the **FR_Swap** message, the Tester intentionally does not reply with a **GoodCRC** message.

d) After **nRetryCount** retries the **FR_Swap** message, the test fails if **Error Recovery** is not detected within **tReceive** max + **tProtErrHardReset** max, the delay is measured from the time the last bit of the last retransmitted **FR_Swap** Message EOP has been received to the time the **Error Recovery** is detected.
TD.PD.FRSISNK3.E3. SenderResponseTimer Times Out

Applicable to:
- UUT: Consumer / Provider, Dual-role Port

Assertions Tested:
8.3.3.16.6.2#3

Description:
Initially as Provider (DFP), after the receipt of the FR_Swap message, the Tester intentionally does not reply with Accept in order to force a SenderResponseTimer time out on the UUT and verifies it is correctly implemented.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Sink.

b) The Tester sends a Fast Role Swap signal to the UUT, with a duration of tFRSwapTx min.

c) Upon receipt of the FR_Swap message, the Tester replies with a GoodCRC message but intentionally does not reply with Accept message to the UUT.

d) The test fails if Error Recovery is not detected within tSenderResponse max + tProtErrHardReset max, the delay is measured from the time the last bit of the GoodCRC Message EOP has been sent to the time the Error Recovery starts.

e) The test fails if Error Recovery is detected before tSenderResponse min, the delay is measured from the time the last bit of the GoodCRC Message EOP has been sent to the time the Error Recovery starts.

TD.PD.FRSISNK3.E4. PSSourceOffTimer Deadline

Applicable to:
- UUT: Consumer / Provider, Dual-role Port

Assertions Tested:
6.6.5.2.2#3, 6.12.1#8

Description:
Initially as Provider (DFP), after accepting a FR_Swap, the Tester sends PS_RDY at the deadline limit of tPSSourceOff min and verifies the UUT accepts this message.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Sink.

b) The Tester sends a Fast Role Swap signal to the UUT, with a duration of tFRSwapTx min.
c) Upon receipt of the FR_Swap message, the Tester replies with a GoodCRC and sends an Accept message to the UUT.

d) The Tester changes termination from Rp to Rd.

e) The Tester sends PS_RDY at the deadline limit of tPSSourceOff min. The delay is measured from the time the last bit of the EOP of the GoodCRC message corresponding to the Accept message was sent to the time the last bit of the EOP of the PS_RDY was sent.

f) The test passes if a GoodCRC is received.

g) The test fails if Error Recovery is detected when waiting the GoodCRC message or before the PS_RDY is sent.

TD.PD.FRSISNK3.E5. PSSourceOffTimer Timeout

Applicable to:
- UUT: Consumer / Provider, Dual-role Port

 Assertions Tested:

6.6.5.2.2#4, 8.3.3.16.6.3#2

Description:

Initially as Provider (DFP), after accepting a FR_Swap, the Tester intentionally does not send PS_RDY, to force a PSSourceOffTimer timeout on the UUT and verifies it is correctly implemented.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Sink.

b) The Tester sends a Fast Role Swap signal to the UUT, with a duration of tFRSwapTx min.

c) Upon receipt of the FR_Swap message, the Tester replies with a GoodCRC and sends an Accept message to the UUT.

d) The Tester changes termination from Rp to Rd.

e) The Tester intentionally does not send PS_RDY, to force a PSSourceOffTimer timeout on the UUT.

f) The test fails if Error Recovery is detected within tPSSourceOff min after the time the last bit of the EOP of the GoodCRC message corresponding to the Accept message was sent, the test fails.

g) The test fails if Error Recovery is not detected after tPSSourceOff max after the time the last bit of the EOP of the GoodCRC message corresponding to the Accept message was sent, the test fails.
TD.PD.FRSISNK3.E6. PS_RDY Not Sent

Applicable to:
- UUT: Consumer / Provider, Dual-role Port

Assertions Tested:
8.3.3.16.6.6#4

Description:
Initially as Provider (DFP), after the receipt of the PS_RDY message, the Tester intentionally does not reply GoodCRC in order to force an Error Recovery on the UUT and verifies it is correctly implemented.

Steps:

a) Run PROC.PD.E4 with the UUT as an initial Sink.

b) The Tester sends a Fast Role Swap signal to the UUT, with a duration of tFRSwapTx min.

c) Upon receipt of the FR_Swap message, the Tester replies with a GoodCRC and sends an Accept message to the UUT.

d) The Tester changes termination from Rp to Rd.

e) The Tester sends PS_RDY with the Port Power Role field = 0b (Sink).

f) The test fails if the PS_RDY is not received within tPSSourceOn min. The delay is measured from the time the last bit of the EOP of the GoodCRC message corresponding to the transmitted PS_RDY message to the time the last bit of the EOP of the PS_RDY is received.

g) Upon receipt of the PS_RDY message, the Tester intentionally does not reply with a GoodCRC message.

h) After nRetryCount retries the PS_RDY message, the test fails if Error Recovery is not detected within tReceive max + tProtErrHardReset max, the delay is measured from the time the last bit of the last retransmitted PS_RDY Message EOP has been received to the time the Error Recovery is detected.
Power Role Swap Tests – Initial Sink

TD.PD.PRSISNK3.E1. Collision Avoidance after PR_Swap

Applicable to:
- UUT: Consumer / Provider, Dual-role Port

Assertions Tested:
- 6.11.2.2.2.1#1, 6.11.2.2.2.1#2

Description:
As Provider (DFP), the Tester initiates a PR_Swap and verifies the UUT set the Rp value to SinkTxOK if it doesn’t have anything to send after Power Role Swap.

Steps:

a) Run PROC.PD.E1 with the UUT as an initial Sink.

b) The Tester sends a PR_Swap to the UUT.
   1. If the UUT’s response is a Wait, the Tester waits 5 seconds to resend PR_SWAP. The Tester sends PR_SWAP up to 3 times, and the test fails if the UUT does not respond with Not_Supported, Reject or Accept.
   2. If the UUT’s response is a Reject or Not_Supported, the test passes and stops here.
   3. If the UUT’s response is an Accept then the Tester proceeds to complete the Power Role Swap.

c) During the 10 second period after Power Role Swap has completed, the Tester monitors the Rp value and verifies the UUT presents SinkTxOK if it doesn’t send any message for 1 second. During this time period, the Tester replies any message sent from the UUT with a proper response.
Consistency Tests

TD. PD. VNDI3. E1. Source Capabilities

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

10.2.3.2#1, 10.2.3.2#3, 10.2.3.2#4, 10.2.3.2#5, 10.2.3.2#7

Description:

This test verifies the returned Source Capabilities match vendor-supplied information.

Steps:

a) Run PROC.PD.E1 Bring-up For DFP UUT steps a and b.

b) In addition to emulating an UFP, the Tester will also present Ra and will reply to SOP’ Discover Identity as Passive Cable with Maximum VBUS Voltage set to 50V and Vbus Current Handling Capability set to 5A.

c) Upon receipt of the Source Capabilities, the Tester checks that:
   1. The Number of Data Objects equals Num_Src_PDOs
   2. The Specification Revision matches with Spec_Revision

d) If Specification Revision is Rev 2.0, the test stops here.

e) For the first PDO, the Tester checks consistency of:
   1. Unchunked_Extended_Messages_Supported if Specification Revision is 10b (Rev 3.0)

f) For each PDO, the Tester checks consistency of:
   1. Src_PDO_Supply_TypeN
   2. If Fixed:
      - Src_PDO_VoltageN
      - Src_PDO_Peak_CurrentN
      - Src_PDO_Max_CurrentN
   3. If Battery:
      - Src_PDO_MinVoltageN
      - Src_PDO_MaxVoltageN
      - Src_PDO_Max_PowerN
   4. If Variable:
      - Src_PDO_Min_VoltageN
      - Src_PDO_Max_VoltageN
      - Src_PDO_Max_CurrentN
5. If Augmented:
   - \( \text{Src PDO Min VoltageN} \)
   - \( \text{Src PDO Max VoltageN} \)
   - \( \text{Src PDO Max CurrentN} \)
   g) The Tester checks all PDOs against the PD.Power_as_Source field in the VIF, and it applies the rules and considerations as outlined in the latest version of USB PD Revision 3.0 specification (including but not limited to the changes as outlined in “USB PD R3.0 V1.1 ECN APDO Min Voltage” and Rounding rules ECN).

**TD. PD. VNDI3. E2. Request**

**Applicable to:**
- UUT: Consumer Only, Consumer / Provider, Dual-role Port

**Assertions Tested:**
- 6.4.2.6#1

**Description:**
The Tester verifies that the Specification Revision and Unchunked Extended Messages Supported in Request message match vendor specific information.

**Steps:**
a) Run PROC.PD.E1 Bring-up for UFP UUT steps a) to d).
b) The Tester sends a Source_Capabilities message to the UUT.
c) Upon receipt of the Request message from the UUT, the Tester checks consistency of:
   1. Specification_Revision
   2. Unchunked_Extended_Messages_Supported if Specification Revision is 10b (Rev 3.0)

**TD. PD. VNDI3. E3. VDM Identity**

**Applicable to:**
- UUT: Consumer Only, Consumer / Provider, Dual-role Port, Provider / Consumer, Provider Only, Cable

**Assertions Tested:**
- 6.2.1.1.5#8, 6.4.4.2#6, 6.4.4.3.1.1.3#1, 6.4.4.3.1.1.6#1, 6.4.4.3.1.1.6#3, 6.4.4.3.1.1.6#4, 6.4.4.3.1.1.6#5, 6.4.4.3.1.1.6#6, 6.4.4.3.1.4.1#14, 6.4.4.3.1.4.2#14

**Description:**
This test verifies that the VDM Information is as specified in the vendor-supplied information.
Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester executes a Discover Identity exchange.

c) If the UUT is not a cable and if Responds_To_Discov_SOP is set to No, the Tester checks that the UUT replies Not_Supported. The test stops here in this case.

d) For Cables, the Tester checks consistency of Specification_Revision.

e) For all devices, the Tester checks in the ID Header consistency of:
   1. Product_Type(UFP)
   2. Product_Type(Cable Plug)
   3. Product_Type(DFP)
   4. USB_VID(_SOP)
   5. Modal_Operation_Supported(_SOP)
   6. Data_Capable_as_USB_Host(_SOP)
   7. Data_Capable_as_USB_Device(_SOP)

f) For all devices, the Tester checks in the Cert Stat VDO consistency of:
   1. XID(_SOP)

g) For all devices, the Tester checks in the Product VDO consistency of:
   1. PID(_SOP)
   2. bcdDevice(_SOP)

h) For Cables, the Tester checks in the Cable VDO consistency of:
   1. Cable_HW_Vers
   2. Cable_FW_Vers
   3. Type_C_to_Type_C_Capt_Vdm_V2
   4. Cable_Latency
   5. Cable_Termination_Type
   6. Max_VBUS_Voltage_Vdm_V2
   7. Cable_VBUS_Current
   8. VBUS_through_cable
   9. Cable_SOP"_controller
   10. Cable_Superspeed_Support

i) For Alt Mode Adapters, the Tester checks in the AMA VDO consistency of:
   1. AMA_HW_Vers
   2. AMA_FW_Vers
   3. AMA_VCONN_power
   4. AMA_VCONN_reqd
   5. AMA_VBUS_reqd
   6. AMA_Superspeed_Support
**TD. PD. VNDI3. E4. Manufacturer Info**

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port, Provider / Consumer, Provider Only, Cable

Assertions Tested:
- 6.5.7.1#1, 6.5.7.2#1

Description:
This test verifies that the returned manufacture info is as specified in the vendor-supplied information.

Steps:
- a) Run PROC.PD.E1 according to the UUT role.
- b) The Tester waits till it can start an AMS if it is in Sink Role.
- c) The Tester sends a Get_Manufacturer_Info message, in which Manufacturer Info Target is set to 0, to the UUT.
- d) If Manufacturer_Info_Supported is set to no, the Tester checks that the UUT replies Not_Supported (if the UUT is not a cable) or ignores the message (if the UUT is a cable). The test stops here in this case.
- e) Upon receipt of the Manufacturer_Info message, the Tester checks consistency of:
  1. Manufacturer_Info_VID(_SOP)
  2. Manufacturer_Info_PID(_SOP)

**TD. PD. VNDI3. E5. Chunking Implemented**

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port, Provider / Consumer, Provider Only, Cable

Assertions Tested:

Description:
This test verifies that the chunking behavior is as specified in the vendor-supplied information.

Steps:
- a) Run PROC.PD.E1 according to the UUT role.
- b) The Tester waits till it can start an AMS if it is in Sink Role.
c) The Tester sends the first chunk of a chunked extended message to the UUT, with Data Size set to 260 and Message Type set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

d) If a message is not received within tChinkingNotSupported max, the Tester verifies Chunking_Implemented(_SOP) is set to no, and the test stops here. The delay is measured from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

e) If the received message is Not_Supported and the UUT is not Cable, the Tester verifies Chunking_Implemented_SOP is set to no, and the test stops here.

f) The Tester verifies the message is received within tChunkReceiverRequest max and Chunking_Implemented(_SOP) is set to yes. The delay is measured from the time the last bit of the EOP of the chunk has been transmitted until the first bit of the response Message Preamble has been received.

TD. PD. VNDI3. E6. Unchunked_Extended_Messages_Supported

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port, Provider / Consumer, Provider Only

Assertions Tested:

6.4.1.2.2.6#1

Description:

This test verifies that if Unchunked_Extended_Messages_Supported is set to yes, the UUT can receive Extended Messages with Data Size > MaxExtendedMsgLegacyLen bytes in a single, Unchunked Message.

Steps:

a) If Unchunked_Extended_Messages_Supported is set to no, this test passes and stops here.

b) Run PROC.PD.E1 Bring-up according to the UUT role.

c) The Tester waits till it can start an AMS if it is in Sink Role.

d) The Tester sends an extended message to the UUT, with Data Size set to 260 and Message Type set to 11111b. Bytes 0 to 259 of data block contain incrementing values (mod 256) starting at 0x00.

e) If a GoodCRC is not received in time, the test fails.

f) If a Not_Supported message is not received within tReceiverResponse max, the test fails. This delay is measured from the time the last bit of the extended message EOP has been transmitted to the time the first bit of the Not_Supported message preamble has been received.
TD. PD. VNDI3, E7. Security_Msgs_Supported

Applicable to:
- UUT: Consumer Only, Consumer / Provider, Dual-role Port, Provider / Consumer, Provider Only, Cable

Assertions Tested:
8.3.3.14.2.1#1, 8.3.3.14.2.1#2

Description:
This test verifies that the support of security messages is as specified in the vendor-supplied information.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits till it can start an AMS if it is in Sink Role.

c) The Tester sends a Security_Request message, in which SRQDB is set to \{0x01, 0x81, 0x00, 0x00\}, to the UUT.

d) If Security_Msgs_Supported(_SOP) is set to no, the Tester checks that the UUT replies Not_Supported (if the UUT is not a cable) or ignores the message (if the UUT is a cable). The test stops here in this case.

e) The Tester verifies a Security_Response message is received within tDigestSent (pay attention to the different values for Unchunked and Chunked), and notifies the user that the UUT must be run through Auth compliance tests in CV.

TD. PD. VNDI3, E8. Sink Capabilities

Applicable to:
- UUT: Consumer Only, Provider / Consumer, Consumer / Provider, Dual-role Port

Assertions Tested:
6.4.1.3.1.6#1, 6.4.1.3.4#1, 6.4.1.3.4#2

Description:
This test verifies the returned Sink Capabilities match vendor-supplied information.

Steps:

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits till it can start an AMS if it is in Sink Role.

c) The Tester sends a Get_Sink_Cap message to the UUT.
d) The Tester waits for the Sink Capabilities and then checks that:
   1. The Number of Data Objects equals Num_Snk_PDOs
   2. The Specification Revision matches with Spec_Revision

e) If Specification Revision is Rev 2.0, the test stops here.

f) For the first PDO, the Tester checks consistency of:
   1. FR_Swap_Reqd_Type_C_Current_As_Initial_Source
   
g) For each PDO, the Tester checks consistency of:
   1. Snk_PDO_Supply_TypeN
   2. If Fixed:
      - Snk_PDO_VoltageN
      - Snk_PDO_Peak_CurrentN
      - Snk_PDO_Max_CurrentN
   3. If Battery:
      - Snk_PDO_MinVoltageN
      - Snk_PDO_MaxVoltageN
      - Snk_PDO_Max_PowerN
   4. If Variable:
      - Snk_PDO_Min_VoltageN
      - Snk_PDO_Max_VoltageN
      - Snk_PDO_Max_CurrentN
   5. If Augmented:
      - Snk_PDO_Min_VoltageN
      - Snk_PDO_Max_VoltageN
      - Snk_PDO_Max_CurrentN

h) The Tester checks that no PDO is above PD_Power_as_Sink.

TD. PD. VNDI3. E9. Source_Capabilities_Extended
Applicable to:
   - UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
   6.5.1.14#1

Description:
   As a Sink (UFP), the Tester verifies the returned Source_Capabilities_Extended match vendor-supplied information.

Steps:
Power Delivery 3.0 Tests

a) Run PROC.PD.E1 Bring-up according to the UUT role.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends a Get_Source_Cap_Extended message to the UUT.

c) If a Not_Supported message is received, the test passes and stops here.

d) Upon receipt of the Source_Capabilities_Extended message, the Tester verifies:
   1. **Source PDP** field is the floor of the PD_Power_as_Source
   2. **Number of Batteries/Battery Slots** field matches with Num_Fixed_Batteries and Num_Swappable_Battery_Slots fields in the VIF

**TD. PD. VNDI3. E10. PR_Swap – Source**

Applicable to:

- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:

6.3.14#1

Description:

As an initial Sink, the Tester verifies the response to PR_Swap matches vendor-supplied information.

Steps:

a) Run PROC.PD.E1 with the UUT as a Source.

b) The Tester sends a **PR_Swap** to the UUT.

   1. If the UUT response is a **Not_Supported**, the Tester verifies that PD_Port_Type field (in the VIF) is set to Provider Only, and the test stops here.
   2. If the UUT response is a **Wait**, the Tester waits 5 seconds to resend **PR_SWAP**. The Tester sends **PR_SWAP** up to 3 times, and the test fails if the UUT does not respond with **Not_Supported, Reject or Accept**.
   3. If the UUT response is a **Reject**, the Tester verifies the following and the test stops here:
      - PD_Port_Type field (in the VIF) is set to Provider / Consumer or Dual-Role Port
      - Accepts_PR_Swap_As_Src field (in the VIF) is set to NO
   4. If the UUT response is an **Accept**, the Tester verifies that PD_Port_Type field (in the VIF) is set to Provider / Consumer or Dual-Role Port. The Tester proceeds to complete the Power Role Swap.

**TD. PD. VNDI3. E11. PR_Swap – Sink**

Applicable to:

- UUT: Consumer Only, Consumer / Provider, Dual-role Port

Assertions Tested:
6.3.14#1

Description:

As an initial Source, the Tester verifies the response to PR_Swap matches vendor-supplied information.

Steps:

a) Run PROC.PD.E1 with the UUT as a Sink.

b) The Tester sends a PR_Swap to the UUT.
   1. If the UUT response is a Not_Supported, the Tester verifies that PD_Port_Type field (in the VIF) is set to Consumer Only, and the test stops here.
   2. If the UUT response is a Wait, the Tester waits 5 seconds to resend PR_SWAP. The Tester sends PR_SWAP up to 3 times, and the test fails if the UUT does not respond with Not_Supported, Reject or Accept.
   3. If the UUT response is a Reject, the Tester verifies the following and the test stops here:
      - PD_Port_Type field (in the VIF) is set to Consumer / Provider or Dual-Role Port
      - Accepts_PR_Swap_As_Snk field (in the VIF) is set to NO
   4. If the UUT response is an Accept, the Tester verifies that PD_Port_Type field (in the VIF) is set to Consumer / Provider or Dual-Role Port. The Tester proceeds to complete the Power Role Swap.

TD. PD. VNDI3. E12. FR_Swap Without Signaling – Source

Applicable to:
- UUT: Provider Only, Provider / Consumer, Dual-role Port

Assertions Tested:
8.3.3.16.5.3#3

Description:

As a Sink, the Tester sends FR_Swap message without a Fast Role Swap signal detected, verifies that Hard Reset is received.

Steps:

a) Run PROC.PD.E1 with the UUT as a Source.

b) The Tester waits until it can start an AMS (Run PROC.PD.E3) and sends FR_Swap message.
   1. If FR_Swap_Reqd_Type_C_Current_As_Initial_Source field (in the VIF) is zero value, the test passes if the UUT sends Not_Supported.
   2. If FR_Swap_Reqd_Type_C_Current_As_Initial_Source field (in the VIF) is nonzero value, verifies that PD_Port_Type field (in the VIF) is not set to Provider Only. The test fails if a Hard Reset is not received within tProtErrHardReset max. The delay is measured from
the time the last bit of the \textit{EOP} of the \textit{GoodCRC} message sent by the UUT in response to the \textit{FR\_Swap} message to the time the first bit of the \textit{Hard Reset} is received.
Appendix A: Power Disconnection for Initial Source Testing

The initial Source testing requires triggering the Source to send a Fast Role Swap signal. One method to trigger sending Fast Role Swap signal is removing the AC mains power from the UUT. In order to support multiple test scenarios, it is important to have a common method for triggering Fast Role Swap signal.

This appendix describes the standard AC mains switch box recommended for used to perform initial Source testing.

Figure 1 shows the schematic of the standard switch box. The switch box has an AC connector to plug into the AC mains and 2 additional receptacles:

- J1 is a 2.1mm barrel jack connector as an alternative for receiving input signal from the Tester
- J2 is an AC plug connecting to the UUT as the power supply

The AC mains (the UUT’s power supply) is allowed to pass if the Tester provides a logical “0” input to the switch box. On the other hand, the AC mains would be disconnected if the Tester provides a logical “1” as the input of the switch box. The function of each components in the schematic as shown in Figure 1:

- R1 is a 10 kΩ resistor, providing current limitation
- R2 is a 100 kΩ resistor, providing high impedance termination
- R3 is a 10 kΩ pull up resistor
- D1 is a Zener diode for protecting high voltage input signal incur on the T1 N-channel MOSFET gate-to-source terminals.
- SW1 is a voltage control switch that is capable of sustain high AC voltage.
- T1 is an N-channel MOSFET that provides open drain input signal to the switch SW1.

When the input signal is higher than 1.26V, the switch box is presented with a logical “1”:

- The T1 transistor would be turned on
- This in turn pulls the drain terminal of T1 transistor to zero and turns off the switch SW1

When the input signal is lower than 0.54V or J1 is not connected, the switch box is presented with a logical “0”:

- The T1 transistor would be turned off
- This in turn pulls up the drain terminal of T1 transistor to VDD voltage and turns on the switch SW1.
- This allows the AC mains power to pass through the switch box.
Input signal provided by the Tester:
Logical “1” turns OFF mains
Logical “0” turns ON mains

Figure 1: schematic of the standard switch box for disconnecting AC mains power
