## 1 Introduction

### 1.1 Scope

The USB Type-C Bridge specification describes the following:

- A methodology for a USB Host to communicate with PD Products attached to Connectors of a PDUSB Hub or attached to the Connector on a charge-through Alternate Mode Adapter.
- An interface to expose and configure the USB Type-C capabilities of Connectors on USB Hubs or Alternate Mode Adapters.
- The ability to expose the Billboard functionality.

This specification is intended for USB hub developers and device driver (System Software) developers. The term System Software is used to describe the software running on the PDUSB Host. Where possible the component of the System Software is called out, for example, the OS Policy Manager (OSPM) or the OS Authentication Manager (OSAM).

The reader is expected to be familiar with [USBTYPESPEC], [USBPD], [USBAUTH], [USBPDFU] and [USBBB]. There may exist conflicts between this specification and one or more of the above mentioned specifications. In such cases [USBTYPESPEC], [USBPD], [USBAUTH], [USBPDFU] and [USBBB] take precedence.

### 1.2 Purpose

The purpose of this specification is to describe the data structures, requests and notification mechanisms that a USB Type-C Bridge is required to support. These data structures, requests and notifications are used in communications between the PDUSB Host and the USB Type-C Bridge. They are used by the PDUSB Host to send requests to, and retrieve capabilities and status from the USB Type-C Bridge.

## 1.4 Terms and Abbreviations

This section defines terms and abbreviations used throughout this document. For additional terms and abbreviations that pertain to the Universal Serial Bus, see Chapter 2, “Terms and Abbreviations,” in [USB2.0] and [USB3.1], Section 1.5 in [USBTYPESPEC], Section 1.6 in [USBPD] and Section 1.4 in [USBBC], and [USBPD].

**Table 1-1: Terms and Abbreviations**

Term	Description
Asynchronous Event	An event that occurs as the result of a condition occurring in or initiated by the PPM.
Billboard Only USB Type-C Bridge	A USB Type-C Bridge in a Device Container that only supports the Billboard functionality and has no Connectors.
Connector	A downstream or charge-through USB Type-C receptacle.
Device Container	A group of one or more USB functions originating from the same physical device.
Device Policy Manager (DPM)	Module running in a Source or Sink that applies Local Policy to each Connector on a Device Container via the Policy Engine. See [USBPD] for more information.
Operating System Authentication Manager (OSAM)	Operating Software that interfaces with the PAM via the USB Type-C Bridge.
Operating System Firmware Update Manager (OSFUM)	Operating Software that interfaces with the PFUM via the USB Type-C Bridge.
Operating System Policy Manager (OSPM)	Operating Software that interfaces with the PPM via the USB Type-C Bridge.
PD Product	Source, Sink, or Cable plug as defined in [USBPD].
Platform Authentication Manager (PAM)	Hardware/firmware that manages all the USB Type-C Authentication functionality. See [USBPD] for more information.
Platform Firmware Update Manager (PFUM)	Hardware/firmware that manages all the USB Type-C Firmware Update functionality for devices attached to Connectors on a Device Container. See [USBPD] for more information.
Platform Policy Manager (PPM)	Hardware/firmware that manages all the Connectors on a Device Container.
PPM Asynchronous Notification	A notification that is generated by the PPM as a result of an Asynchronous Event.
PPM Command Response	A notification that is generated by the PPM as a response to a PPM Command.

## 1.5 Conventions and Notations

### 1.5.1 Precedence

If there is a conflict between text, figures, and tables, the precedence shall be tables, figures, and then text.

### **1.5.2 Keywords**

The following keywords differentiate between the levels of requirements and options.

#### **1.5.2.1 Informative**

Informative is a keyword that describes information with this specification that intends to discuss and clarify requirements and features as opposed to mandating them.

#### **1.5.2.2 May**

May is a keyword that indicates a choice with no implied preference.

#### **1.5.2.3 N/A**

N/A is a keyword that indicates that a field or value is not applicable and has no defined value and shall not be checked or used by the recipient.

#### **1.5.2.4 Normative**

Normative is a keyword that describes features that are mandated by this specification.

#### **1.5.2.5 Optional**

Optional is a keyword that describes features not mandated by this specification. However, if an optional feature is implemented, the feature shall be implemented as defined by this specification (optional normative).

#### **1.5.2.6 Reserved**

Reserved is a keyword indicating reserved bits, bytes, words, fields, and code values that are set-aside for future standardization. Their use and interpretation may be specified by future extensions to this specification and, unless otherwise stated, shall not be utilized or adapted by vendor implementation. A reserved bit, byte, word, or field shall be set to zero by the sender and shall be ignored by the receiver. Reserved field values shall not be sent by the sender and, if received, shall be ignored by the receiver.

#### **1.5.2.7 Shall**

Shall is a keyword indicating a mandatory (normative) requirement. Designers are mandated to implement all such requirements to ensure interoperability with other compliant Devices.

#### **1.5.2.8 Should**

Should is a keyword indicating flexibility of choice with a preferred alternative. Equivalent to the phrase "it is recommended that".

### **1.5.3 Numbering**

Numbers that are immediately followed by a lowercase "b" (e.g., 01b) are binary values. Numbers that are immediately followed by an uppercase "B" are byte values. Numbers that are immediately followed by a lowercase "h" (e.g., 3Ah) are hexadecimal values. Numbers not immediately followed by either a "b", "B", or "h" are decimal values.

### **1.5.4 Byte Ordering**

All multiple byte fields in this specification are interpreted as and moved over the bus in little-endian order, i.e., LSB to MSB unless otherwise specified.

## 2 Management Overview

The USB Type-C Bridge defined by this specification can only be implemented either as an integral part of a PDUSB Hub or as part of a PDUSB Device (for example an Alternate Mode Adapter that supports charge-through, includes a Connector for connection to a charger and also supports Billboard functionality). The term “Device Container” is used in this specification to refer to a PDUSB Hub or PDUSB Device that includes a USB Type-C Bridge.

This specification defines the various requests and notifications to enable communication between a USB Host and the Connectors on a Device Container via the USB Type-C Bridge. It details the initialization sequence to determine the number of Connectors that are exposed via the USB Type-C Bridge, and how system software in the USB Host can determine the USB PD and USB Type-C capabilities of both the Device Container and the Connectors on that Device Container that are exposed via the USB Type-C Bridge.

The USB Descriptors and Requests used to communicate between a USB Type-C Bridge Class Driver in a USB Host and a USB Type-C Bridge in a Device Container are specified using a reference architecture, illustrated in Figure 2-1. In this reference architecture, the USB Host contains an OS Policy Manager (OSPM), an OS Authentication Manager (OSAM) and an OS Firmware Update Manager (OSFUM). The Device Container contains a USB Type-C Bridge that contains a Platform Policy Manager (PPM), a Platform Authentication Manager (PAM), a Platform Firmware Update Manager (PFUM) and the USB PD Logic. The USB PD Logic contains the USB PD Device Policy Manager, a PD Policy Engine for each Connector, a PD Protocol Layer for each Connector, and a PD PHY for each Connector.

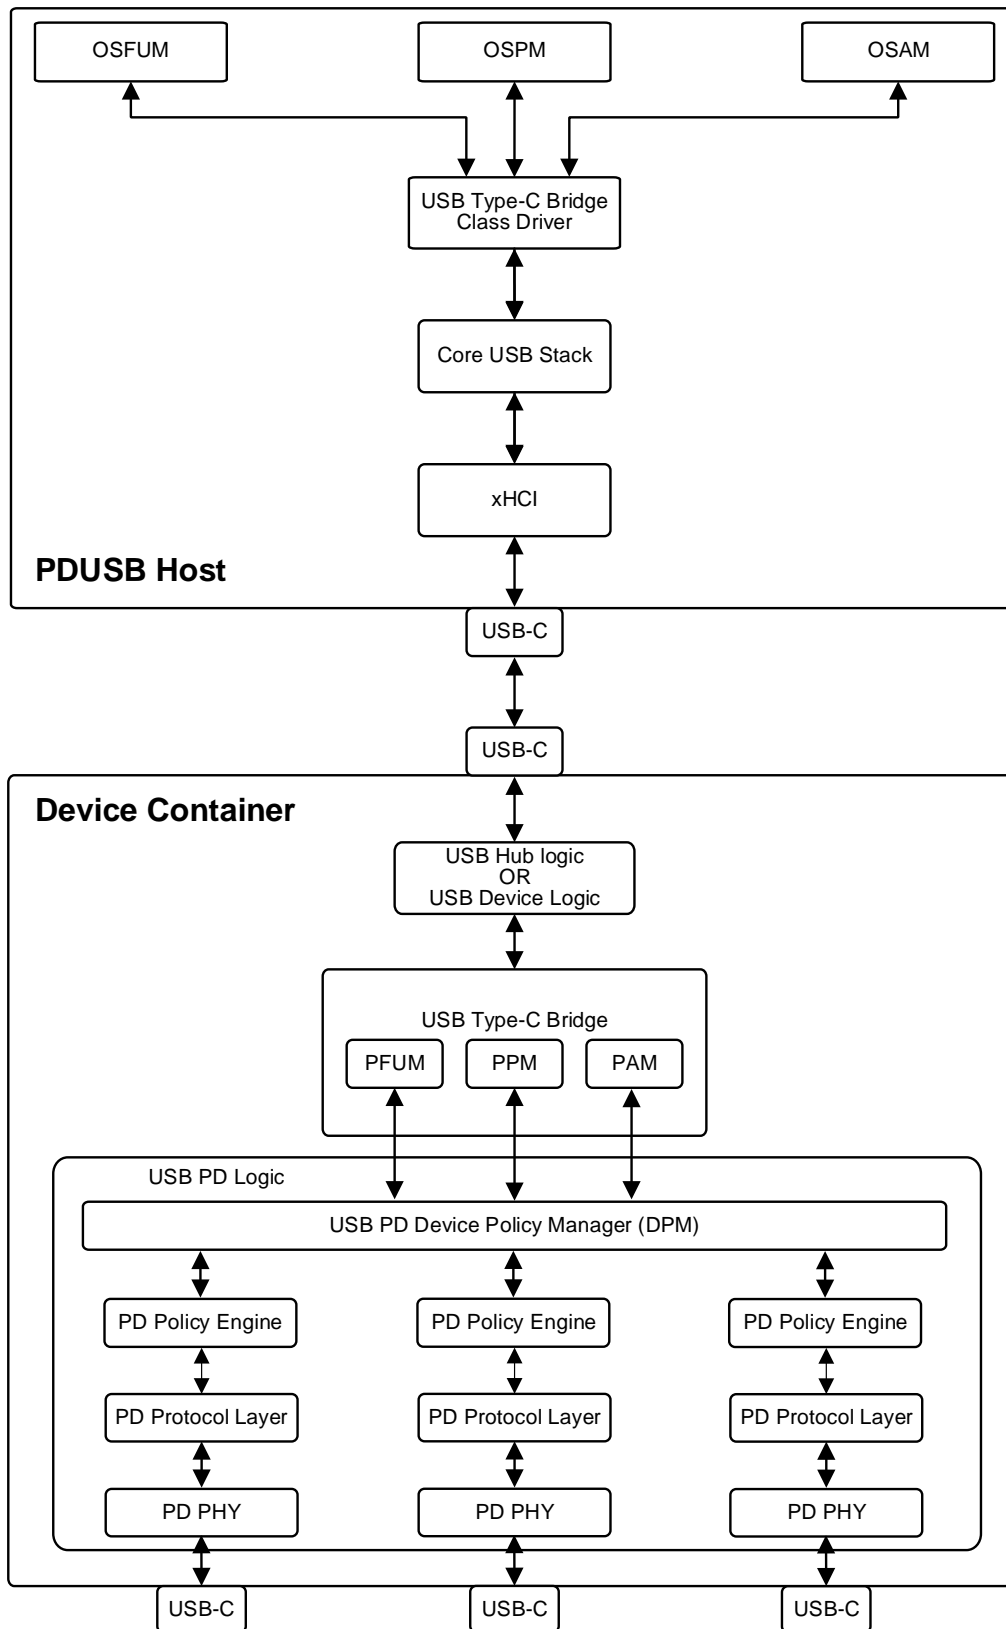

The OSPM, OSAM and OSFUM communicate with the USB Type-C Bridge Class driver. The PPM, PAM and PFUM communicate with the Device Policy Manager that in turn manages the transmission and reception of appropriate messages on the Connector via the Connector’s PD Policy Engine and, indirectly, the Connector’s PD Protocol Layer and PD PHY.

The USB Descriptors and Requests used to communicate between a USB Type-C Bridge Class Driver and a USB Type-C Bridge are defined in Section 3. The PPM Commands, PPM Command Responses and PPM Asynchronous Notifications are defined in Section 4. The Operational Model of the USB Type-C Bridge is defined Section 5. This specification does not define or require any particular System Software policies.

Figure 2-1 depicts:

- The relationship between the OS Policy Manager (OSPM) and Platform Policy Manager (PPM) in the USB Type-C Bridge, and in turn, the relationship between the PPM and the USB PD Device Policy Manager (DPM) defined in [USBPD].
- The relationship between the OS Authentication Manager (OSAM) and the Platform Authentication Manager (PAM), and, in turn, the relationship between the PAM and the USB PD Device Policy Manager (DPM). The PAM in the Device Container acts as a pass-thru for USB PD Authentication commands, allowing the OSAM in the PDUSB Host to exchange USB PD Authentication commands with a PD Product attached to a Connector on the Device Container.
- The relationship between the OS Firmware Update Manager (OSFUM) and the Platform Firmware Update Manager (PFUM), and, in turn, the relationship between the PFUM and the USB PD Device Policy Manager (DPM). The PFUM in the Device Container acts as a pass-thru for USB PD Firmware Update commands, allowing the OSFUM in the PDUSB Host to exchange USB PD Firmware Update commands with a PD Product attached to a Connector on the Device Container.

**Figure 2-1 USB Type-C Bridge Reference Architecture**

### 3 USB Descriptors and Requests

This section defines the data structures, descriptors and requests used to communicate between a USB Type-C Bridge Class Driver in a PDUSB Host and a USB Type-C Bridge in a Device Container.

#### 3.1 Descriptors

A USB Type-C Bridge shall return all the descriptors and respond to all standard USB commands as defined in Chapter 9 of [USB2.0]. A USB Type-C Bridge shall only return the Class, Subclass and Protocol values as defined in Appendix A in its Interface descriptor. In addition, it shall set its *bcdUSB* value to 0201h in its Device descriptor. The USB Type-C Bridge shall only expose one interface. The interface consists of:

- One Interrupt IN endpoint (Notification endpoint).
- A class-specific Bridge Capability descriptor that shall immediately follow the Interface descriptor in the list of descriptors returned by the USB Type-C Bridge.

The Bridge Capability descriptor shall have the structure defined in Table 3-1.

**Table 3-1: Bridge Capability Descriptor**

Offset	Field	Size	Value	Description												
0	<i>bLength</i>	1	Number	Size of this Descriptor in Bytes (7)												
1	<i>bDescriptorType</i>	1	Constant	BRIDGE_CAPABILITY Descriptor Type												
2	<i>bcdVersion</i>	2	BCD	Version of the USB Type-C Bridge Specification that the USB Type-C Bridge is compliant to and shall be set to 0100h.												
4	<i>bmConnectorMask</i>	2	Bitmap	This field indicates which of the Connector on the Device Container the USB Type-C Bridge can communicate with. The maximum number of Connectors a USB Type-C Bridge can support is limited to fifteen. If a bit is set to one, then the USB Type-C Bridge shall be able communicate with that Connector. The maximum number of bits set to one in this field shall be equal to the value returned in the <b>bNumConnectors</b> field in response to a Get Capability (See Section 4.2.7) PPM Command. Bit 0 is Reserved and shall be set to zero.												
6	<i>bmAttributes</i>	1	Bitmap	<table><tr><th>Bit</th><th>Description</th></tr><tr><td>0</td><td>If this bit is set to one then the USB Type-C Bridge supports PPM functionality.</td></tr><tr><td>1</td><td>If this bit is set to one then the USB Type-C Bridge supports a PAM functionality.</td></tr><tr><td>2</td><td>If this bit is set to one then the USB Type-C Bridge supports PFUM functionality.</td></tr><tr><td>3</td><td>If this bit is set to one then the USB Type-C Bridge supports Billboard functionality.</td></tr><tr><td>4-7</td><td>Reserved and shall be set to zero.</td></tr></table>	Bit	Description	0	If this bit is set to one then the USB Type-C Bridge supports PPM functionality.	1	If this bit is set to one then the USB Type-C Bridge supports a PAM functionality.	2	If this bit is set to one then the USB Type-C Bridge supports PFUM functionality.	3	If this bit is set to one then the USB Type-C Bridge supports Billboard functionality.	4-7	Reserved and shall be set to zero.
Bit	Description															
0	If this bit is set to one then the USB Type-C Bridge supports PPM functionality.															
1	If this bit is set to one then the USB Type-C Bridge supports a PAM functionality.															
2	If this bit is set to one then the USB Type-C Bridge supports PFUM functionality.															
3	If this bit is set to one then the USB Type-C Bridge supports Billboard functionality.															
4-7	Reserved and shall be set to zero.															

**The Notification endpoint shall have the characteristics defined in**

Table 3-2.

**Table 3-2: Notification Endpoint**

Offset	Field	Size	Value	Description
0	<i>bLength</i>	1	Number	Size of this Descriptor in Bytes (9)
1	<i>bDescriptorType</i>	1	Constant	ENDPOINT Descriptor Type
2	<i>bEndpointAddress</i>	1	Endpoint	Address of the Endpoint
3	<i>bmAttributes</i>	1	Bitmap	03h (Interrupt Endpoint)
4	<i>wMaxPacketSize</i>	2	Number	40h
6	<i>bInterval</i>	1	Number	04h (1ms Intervals)

The data structure of the notifications that a USB Type-C Bridge sends on the Interrupt IN endpoint shall be as defined in Table 3-3.

**Table 3-3: Notification Data Structure**

Offset	Field	Size	Value	Description
0	<i>bNotificationType</i>	1	Number	Identifies the Notification Type. The various notifications a USB TYPE-C Bridge may send are listed in Appendix A.
1	<i>bParam1</i>	1	Number	Notification Type-specific Parameter 1.
2	<i>bParam2</i>	1	Number	Notification Type-specific Parameter 2.
3	<i>bParam3</i>	1	Number	Notification Type-specific Parameter 3.
4	<i>Payload</i>	N	Data	Notification Type-specific Data.

## 3.2 USB Class-Specific Requests

### 3.2.1 PPM Functionality

This section defines the following:

- Class-specific USB Requests used to by the USB Type-C Bridge Class Driver to encapsulate PPM Commands originated by the OSPM.
- USB Type-C Bridge PPM Notification structure that shall be used to encapsulate the PPM Command Responses and PPM Asynchronous Notifications that a PPM (in the USB Type-C Bridge) may send to an OSPM via the USB Type-C Bridge Class Driver.

Section 4 defines the structure of the PPM Commands and PPM Command Responses/PPM Asynchronous Notifications exchanged between the OSPM and the PPM. A USB Type-C Bridge shall only use the PPM Commands and PPM Command Responses/PPM Asynchronous Notifications as defined in Section 4.

The USB Type-C Bridge that is not a Billboard Only USB Type-C Bridge shall support PPM functionality (see Table 3-1) so as to enable a PDUSB Host to query the capabilities of Connectors on the Device Container. A Billboard Only USB Type-C Bridge shall not support PPM functionality.

### 3.2.1.1 Send PPM Command Request

The Send PPM Command Request shall be used by the USB Type-C Bridge Class Driver to send PPM Commands to the PPM in a USB Type-C Bridge.

**Table 3-4: Send PPM Command Request Fields**

<b>bmRequestType</b>	<b>bRequest</b>	<b>wValue</b>	<b>wIndex</b>	<b>wLength</b>	<b>Data</b>
00100000B	SEND_PPM_COMMAND	00h	00h	Varies	Varies

The OSPM sends a PPM Command and any related data to the USB Type-C Bridge Class Driver which shall encapsulate the PPM Command and the related data in the **Data** field of the SEND\_PPM\_COMMAND Request. The USB Type-C Bridge Class Driver shall set the **wLength** field to the number of bytes in the **Data** field.

### 3.2.1.2 USB Type-C Bridge PPM Notification

The PPM in a USB Type-C Bridge shall use the notification data structure in Table 3-3 to send a PPM Command Response or a PPM Asynchronous Notification back to the OSPM via the USB Type-C Bridge Class Driver. The contents of the PPM Notification are given in Table 3-5.

**Table 3-5: USB Type-C Bridge PPM Notification**

<b>Offset</b>	<b>Field</b>	<b>Size</b>	<b>Value</b>	<b>Description</b>
0	<i>bNotificationType</i>	1	Number	Set to PPM_NOTIFICATION.
1	<i>bParam1</i>	1	Number	Shall be set to 00h.
2	<i>bParam2</i>	1	Number	Shall be set to 00h.
3	<i>bParam3</i>	1	Number	Shall be set to 00h.
4	<i>Payload</i>	N	Data	Set to the PPM Command Response or PPM Asynchronous Notification. If there is any additional data associated with the PPM Command Response, that data shall be appended to the end of the PPM Command Response.

### 3.2.2 PAM Functionality

This section defines the following:

- Class-specific USB Requests used by the USB Type-C Bridge Class Driver to encapsulate Authentication Requests or Authentication Responses originated by the OSAM.
- USB Type-C Bridge PAM Notification structure that shall be used to encapsulate the Authentication Notifications/Authentication Command Responses that a PAM (in the USB Type-C Bridge) may send to an OSAM via the USB Type-C Bridge Class Driver.

Authentication Requests and Responses shall be as defined in [USBAUTH].

The USB Type-C Bridge that is not a Billboard Only USB Type-C Bridge shall support PAM functionality (see Table 3-1) so as to ensure that a PD Product attached to a Connector on a Device Container can be Authenticated. A Billboard Only USB Type-C Bridge shall not support PAM functionality.

### 3.2.2.1 Send Authentication Data Request

The Send Authentication Data Request shall be used by the USB Type-C Bridge Class Driver to transmit an Authentication Request or Response to a Connector on a Device Container via the USB Type-C Bridge.

**Table 3-6: Send Authentication Data Request Fields**

<b>bmRequestType</b>	<b>bRequest</b>	<b>wValue</b>	<b>wIndex</b>	<b>wLength</b>	<b>Data</b>
00100000B	SEND_PD_DATA	AUTH	Connector Number   Target	Varies	Varies

The OSAM sends either an Authentication Request or Authentication Response to the USB Type-C Bridge Class Driver, which shall encapsulate it in the **Data** of the SEND\_PD\_DATA request.

The USB Type-C Bridge Class Driver shall set the **wValue** field to AUTH when it is sending Authentication Data. It shall set the Target, in the low byte of **wIndex**, to one of SOP (0), SOP' (1) or SOP'' (2) and the Connector Number in the high byte of **wIndex**. The USB Type-C Bridge Class Driver shall set the **wLength** field to the number of bytes in the **Data** field.

### 3.2.2.2 Get Authentication Data Request

The Get Authentication Data Request shall be used by the USB Type-C Bridge Class driver to fetch an Authentication Request or Authentication Response from a Connector on a Device Container via the USB Type-C Bridge.

**Table 3-7: Get Authentication Data Request Fields**

<b>bmRequestType</b>	<b>bRequest</b>	<b>wValue</b>	<b>wIndex</b>	<b>wLength</b>	<b>Data</b>
10100000B	GET_PD_DATA	AUTH	Connector Number   Target	Varies	Varies

The USB Type-C Bridge shall send any received Authentication Request or Authentication Response in the **Data** that is sent in response to the GET\_PD\_DATA request.

The USB Type-C Bridge Class Driver shall set the **wValue** field to AUTH when it is requesting Authentication Data. It shall set the Target, in the low byte of **wIndex**, to one of SOP (0), SOP' (1) or SOP'' (2) and the Connector Number in the high byte of **wIndex**. The USB Type-C Bridge Class Driver shall set the **wLength** field to the maximum number of bytes the USB Type-C Bridge may return in response to this Request.

### 3.2.2.3 Authentication Notification

The Authentication Notification shall be sent by the USB Type-C Bridge to indicate to the OSAM that it received an Authentication Request or Response from a Connector on the Device Container. The Authentication Notification shall be used to transmit the result of a Send Authentication Data Request sent by the OSAM to the PAM. The USB Type-C Bridge shall use the notification data structure in Table 3-3. The contents of the Authentication Notification shall be as detailed in Table 3-8.

**Table 3-8: Authentication Notification**

Offset	Field	Size	Value	Description
0	<i>bNotificationType</i>	1	Number	Set to PD_NOTIFICATION.
1	<i>bParam1</i>	1	Number	Set to the Connector Number.
2	<i>bParam2</i>	1	Number	Set to AUTH.
3	<i>bParam3</i>	1	Number	Set to either Error (80h) or Success (00h)
4	<i>Payload</i>	N	Data	No payload.

### 3.2.3 PFUM Functionality

This section defines the following:

- Class-specific USB Requests used by the USB Type-C Bridge Class Driver to encapsulate Firmware Update Requests originated by the OSFUM.
- USB Type-C Bridge PFUM Notification structure that shall be used to encapsulate the Firmware Update Command Responses that a PFUM (in the USB Type-C Bridge) may send to an OSFUM via the USB Type-C Bridge Class Driver.

Firmware Update Requests and Responses shall be as defined in [USBPDFU].

The USB Type-C Bridge that is not a Billboard Only USB Type-C Bridge shall support PFUM functionality (see Table 3-1) so as to ensure that the firmware on a PD Product attached to a Connector on a Device Container can be updated. A Billboard Only USB Type-C Bridge shall not support PFUM functionality.

#### 3.2.3.1 Send Firmware Update Data Request

The Send Firmware Update Data Request shall be used by the USB Type-C Bridge Class Driver to transmit a FW Update Request to a PD Product attached to a Connector on a Device Container via the USB Type-C Bridge.

**Table 3-9: Send Firmware Update Data Request Fields**

bmRequestType	bRequest	wValue	wIndex	wLength	Data
00100000B	SEND_PD_DATA	FWU	Connector Number   Target	Varies	Varies

The OSFUM sends a Firmware Update Request to the USB Type-C Bridge Class Driver, which shall encapsulate it in the **Data** of the SEND\_PD\_DATA request.

The USB Type-C Bridge Class Driver shall set the **wValue** field to FWU when it is sending Firmware Update Data. It shall set the Target, in the low byte of **wIndex**, to one of SOP (0), SOP' (1) or SOP'' (2). The USB Type-C Bridge Class Driver shall set the **wLength** field to the number of bytes in the **Data** field.

#### 3.2.3.2 Firmware Update Notification

The Firmware Update Notification shall be used by the USB Type-C Bridge to transmit a Firmware Update Response to the OSFUM from a PD Product attached to a Connector on a Device Container. The USB Type-C Bridge shall use the notification data structure in Table 3-3. The contents of the Firmware Update Notification shall be as defined in Table 3-10.

**Table 3-10: Firmware Update Notification**

Offset	Field	Size	Value	Description
0	<i>bNotificationType</i>	1	Number	Set to PD_NOTIFICATION.
1	<i>bParam1</i>	1	Number	Set to the Connector Number.
2	<i>bParam2</i>	1	Number	Set to FWU.
3	<i>bParam3</i>	1	Number	Shall be set to 00h.
4	<i>Payload</i>	N	Data	Firmware Update Response. See [USBPDFU]

### 3.2.4 Billboard Functionality

This section defines the following:

- Class-specific USB Requests used by the USB Type-C Bridge Class Driver to enable Billboard Notifications from the USB Type-C Bridge.
- USB Type-C Bridge Billboard Notification structure that shall be used to indicate changes to the Billboard Capability to the USB Type-C Bridge Class Driver.

The USB Type-C Bridge shall optionally support the Billboard functionality (see Table 3-1) using the methodology described in this specification.

#### 3.2.4.1 Enable/Disable Billboard Notification Request

The Enable/Disable Billboard Notification Request shall be used by the USB Type-C Bridge Class Driver to enable or disable Billboard Notifications from the USB Type-C Bridge.

**Table 3-11: Enable/Disable Billboard Notification Request Fields**

bmRequestType	bRequest	wValue	wIndex	wLength	Data
00100000B	ENABLE_BB_NOTIFICATION	Enable or Disable	00h	00h	No data

The USB Type-C Bridge Class Driver shall set the **wValue** field to Enable (1) when it wants to enable Billboard Notifications from the USB Type-C Bridge. It shall set the **wValue** field to Disable (0) when it wants to disable Billboard Notifications from the USB Type-C Bridge.

#### 3.2.4.2 Billboard Notification

The Billboard Notification shall be sent by the USB Type-C Bridge to indicate that there is a change to the Billboard Capability in the Device Container. The USB Type-C Bridge shall use the notification data structure in Table 3-3. The contents of the Billboard Notification shall be as detailed in Table 3-12.

**Table 3-12: Billboard Notification**

Offset	Field	Size	Value	Description
0	<i>bNotificationType</i>	1	Number	Set to BILLBOARD_NOTIFICATION.
1	<i>bParam1</i>	1	Number	Shall be set to 00h.
2	<i>bParam2</i>	1	Number	Shall be set to 00h.
3	<i>bParam3</i>	1	Number	Shall be set to 00h.
4	<i>Payload</i>	N	Data	No Payload.

## 4 PPM Commands, PPM Command Responses and PPM Asynchronous Notifications

This section describes the only data structures and PPM Commands that a OSPM shall use in order to communicate with the PPM in the USB Type-C Bridge and the requirements of the PPM in the USB Type-C Bridge when it receives a PPM Command. It also defines the structure of the PPM Command Responses and the PPM Asynchronous Notification that a PPM in the USB Type-C Bridge shall send to the OSPM in response to a PPM Command or due to an Asynchronous Event.

### 4.1 Data Structures

#### 4.1.1 COMMAND

The COMMAND Data Structure is sent as the **Data** of a SEND\_PPM\_COMMAND Request, and defines the PPM Command that shall be executed by the PPM in the USB Type-C Bridge. Depending on the Command Type, some fields in this Data Structure need to be interpreted differently. This section defines the high level structure of both the fields that are static and the fields that change based on the PPM Command. Subsequent sections define the structure of the COMMAND Data Structure for each type of PPM Command.

**Table 4-1: COMMAND Data Structure**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	The value in this field determines the Command that OSPM wants the PPM to execute. Bits 16-63 shall contain any parameters specific to this Command.
8	<i>Reserved</i>	8	Reserved and shall be set to zero.
16	<i>Command Specific</i>	48	The definition of these bits is different for each Command that can be sent to the PPM.

Section 4.2 describes the definition of the **Command Specific** field for each PPM Command that can be sent to a PPM.

#### 4.1.2 PPM Command Response or PPM Asynchronous Notification

When the PPM completes a PPM Command or when it detects an Asynchronous Event on one of its Connectors it shall send a PPM Command Response or a PPM Asynchronous Notification respectively to the OSPM. A PPM Command Response or PPM Asynchronous Notification shall be as detailed in Table 4-2.

**Table 4-2: PPM Command Response or PPM Asynchronous Notification Data Structure**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	The PPM shall use this field to indicate the Connector Number that a change occurred on. The only valid values in this field shall be 0 to the maximum number of Connectors supported on the platform. Connectors are indexed from 1. If this field is set to zero, then no change occurred on any of the Connectors.

Offset (Bits)	Field	Size (Bits)	Description
8	<i>Data Length</i>	8	<p>This field shall indicate the number of additional bytes of data that follow a PPM Command Response. The format and contents of the data is dependent on the PPM Command Response.</p> <p>The value in this field shall be less than or equal to MAX_DATA_LENGTH for a PPM Command Response.</p> <p>This field shall be set to zero if this is a PPM Asynchronous Notification.</p>
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	<p>The PPM shall set this field to one when it wants to indicate that it does not currently support a PPM Command.</p> <p>This field shall only be valid when the <b>Command Completed Indicator</b> field is set to one.</p>
26	<i>Cancel Completed Indicator</i>	1	<p>The PPM shall set this field to one when it has completed a CANCEL Command.</p> <p>This field shall only be valid when the <b>Command Completed Indicator</b> field is set to one.</p>
27	<i>Reset Completed Indicator</i>	1	<p>The PPM shall set this field to one when it has completed a PPM_RESET Command.</p> <p>If this field is set to one, then no other bits in this Data Structure shall be set by the PPM.</p> <p>The PPM shall clear this field on reception of the next PPM Command (not PPM_RESET) from the OSPM.</p>
28	<i>Busy Indicator</i>	1	This value in this field shall be ignored as the field is not supported in this version of the specification.
29	<i>Acknowledge Command Indicator</i>	1	<p>The PPM shall set this field to one when it completes the ACK_PCR_PAN (Acknowledge PPM Command Response and/or PPM Asynchronous Notification) Command. The PPM shall automatically reset this bit when it receives the next PPM Command from the OSPM.</p> <p>If this field is set to one, then the only other field that can be set is the <b>Connector Change Indicator</b> field.</p>
30	<i>Error Indicator</i>	1	<p>The PPM shall set this field to one when it encounters an error when executing the PPM Command sent to it by the OSPM.</p> <p>This field shall only be valid when the <b>Command Completed Indicator</b> field is set to one.</p>
31	<i>Command Completed Indicator</i>	1	The PPM shall set this field to one when it wants to indicate that it completed the PPM Command sent to it by the OSPM.

## 4.2 PPM Commands

### 4.2.1 Command Codes

Table 4-3 details the only Command Codes that shall be used in PPM Commands as well as Reserved values.

**Table 4-3: Command Code**

Command	Value
RESERVED (shall not be used)	00h
PPM_RESET	01h
CANCEL	02h
CONNECTOR_RESET	03h
ACK_PCR_PAN	04h
SET_NOTIFICATION_ENABLE	05h
GET_CAPABILITY	06h
GET_CONNECTOR_CAPABILITY	07h
RESERVED (shall not be used)	08h – 11h
GET_CONNECTOR_STATUS	12h
GET_ERROR_STATUS	13h
RESERVED (shall not be used)	14h – FFh

### 4.2.2 PPM RESET

The PPM\_RESET Command shall be used to reset the PPM. It may be sent at any time by the OSPM to the PPM. The format of the COMMAND Data Structure shall be as detailed in Table 4-4.

**Table 4-4: PPM\_RESET Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to PPM_RESET.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	48	Reserved and shall be set to zero.

On successful completion of the PPM\_RESET Command the PPM shall return a PPM Command Response as described in Table 4-5.

**Table 4-5: PPM\_RESET Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	Shall be set to 00h.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.

Offset (Bits)	Field	Size (Bits)	Description
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.
27	<i>Reset Completed Indicator</i>	1	Shall be set to 01h. The PPM shall clear this field on reception of the next PPM Command from the OSPM.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	Shall be set to 00h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 00h.

#### 4.2.3 CANCEL

The CANCEL Command shall be used to cancel a PPM Command previously sent to the PPM.

The format of the COMMAND Data Structure shall be as detailed in Table 4-6.

**Table 4-6: CANCEL Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to CANCEL.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	48	Reserved and shall be set to zero.

On successful completion of the CANCEL Command the PPM shall return a PPM Command Response as described in Table 4-7.

**Table 4-7: CANCEL Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	If an Asynchronous Event occurred on a Connector, then the PPM shall set this field to the Connector Number on which the change occurred.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Set to 01h

Offset (Bits)	Field	Size (Bits)	Description
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	Shall be set to 00h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 01h.

#### 4.2.4 Connector Reset

This CONNECTOR\_RESET Command is reserved in this version of the specification.

#### 4.2.5 Acknowledge PPM Command Response and/or PPM Asynchronous Notification

The ACK\_PCR\_PAN Command shall be used to acknowledge to the PPM that the OSPM received and processed a PPM Command Response or PPM Asynchronous Notification. The OSPM acknowledges either the Command Completion or the Connector Change or both by setting the appropriate fields in the COMMAND Data Structure. The format of the COMMAND Data Structure shall be as detailed in Table 4-8.

**Table 4-8: ACK\_PCR\_PAN Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to ACK_PCR_PAN.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Connector Change Acknowledge</i>	1	The OSPM shall set this field to a one to acknowledge a connector change that occurred on the Connector indicated by the PPM in the CCI Data Structure.
17	<i>Command Completed Acknowledge</i>	1	The OSPM shall set this field to a one to acknowledge that a PPM Command completed.
18	<i>Reserved</i>	46	Reserved and shall be set to zero.

On successful completion of the ACK\_PCR\_PAN Command the PPM shall return a PPM Command Response as described in Table 4-9.

**Table 4-9: ACK\_PCR\_PAN Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	Shall be set to 00h.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.

Offset (Bits)	Field	Size (Bits)	Description
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 01h.
30	<i>Error Indicator</i>	1	Shall be set to 00h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 00h.

#### 4.2.6 Set Notification Enable

The SET\_NOTIFICATION\_ENABLE Command shall be used to set the list of Asynchronous Events that the PPM may send PPM Asynchronous Notifications about to the OSPM. The OSPM may update the list at any time. The format of the COMMAND Data Structure shall be as detailed in Table 4-10.

If any PPM Asynchronous Notification is enabled, the **Command Completed Notification Enable** shall also be enabled.

**Table 4-10: SET\_NOTIFICATION\_ENABLE Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to SET_NOTIFICATION_ENABLE.
8	<i>Data Length</i>	8	Shall be set to 00h.

Offset (Bits)	Field	Size (Bits)	Description																																		
16	Notification Enable	16	<div>The list of notifications that the OSPM wants to Enable.<table><tr><th>Bit</th><th>Notification Enabled when set to 1</th></tr><tr><td>0</td><td>Command Completed</td></tr><tr><td>1</td><td>Reserved and shall be set to zero</td></tr><tr><td>2</td><td>Power Operation Mode Change</td></tr><tr><td>3</td><td>Reserved and shall be set to zero</td></tr><tr><td>4</td><td>Reserved and shall be set to zero</td></tr><tr><td>5</td><td>Supported Provider Capabilities Change</td></tr><tr><td>6</td><td>Negotiated Power Level Change</td></tr><tr><td>7</td><td>PD Reset Complete</td></tr><tr><td>8</td><td>Reserved and shall be set to zero</td></tr><tr><td>9</td><td>Battery Charging Status Change</td></tr><tr><td>10</td><td>Reserved and shall be set to zero</td></tr><tr><td>11</td><td>Connector Partner Change</td></tr><tr><td>12</td><td>Power Direction Change</td></tr><tr><td>13</td><td>Reserved and shall be set to zero</td></tr><tr><td>14</td><td>Connect Change</td></tr><tr><td>15</td><td>Error</td></tr></table></div>	Bit	Notification Enabled when set to 1	0	Command Completed	1	Reserved and shall be set to zero	2	Power Operation Mode Change	3	Reserved and shall be set to zero	4	Reserved and shall be set to zero	5	Supported Provider Capabilities Change	6	Negotiated Power Level Change	7	PD Reset Complete	8	Reserved and shall be set to zero	9	Battery Charging Status Change	10	Reserved and shall be set to zero	11	Connector Partner Change	12	Power Direction Change	13	Reserved and shall be set to zero	14	Connect Change	15	Error
Bit	Notification Enabled when set to 1																																				
0	Command Completed																																				
1	Reserved and shall be set to zero																																				
2	Power Operation Mode Change																																				
3	Reserved and shall be set to zero																																				
4	Reserved and shall be set to zero																																				
5	Supported Provider Capabilities Change																																				
6	Negotiated Power Level Change																																				
7	PD Reset Complete																																				
8	Reserved and shall be set to zero																																				
9	Battery Charging Status Change																																				
10	Reserved and shall be set to zero																																				
11	Connector Partner Change																																				
12	Power Direction Change																																				
13	Reserved and shall be set to zero																																				
14	Connect Change																																				
15	Error																																				
32	Reserved	32	Reserved and shall be set to zero.																																		

On successful completion of the SET\_NOTIFICATION\_ENABLE Command the PPM shall return a PPM Command Response as described in Table 4-11.

**Table 4-11: SET\_NOTIFICATION\_ENABLE Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	If an Asynchronous Event occurred on a Connector, then the PPM shall set this field to the Connector Number on which the change occurred.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	If the PPM Command was not successfully completed the PPM shall set this field to 01h.

Offset (Bits)	Field	Size (Bits)	Description
31	<i>Command Completed Indicator</i>	1	Shall be set to 01h.

#### 4.2.7 Get Capability

The GET\_CAPABILITY Command shall be used to get the PPM capabilities. The format of the COMMAND Data Structure shall be as detailed in Table 4-12.

**Table 4-12: GET\_CAPABILITY Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to GET_CAPABILITY.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	48	Reserved and shall be set to zero.

On successful completion of the GET\_CAPABILITY Command the PPM shall return a PPM Command Response as described in Table 4-13.

**Table 4-13: GET\_CAPABILITY Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	If an Asynchronous Event occurred on a Connector, then the PPM shall set this field to the Connector Number on which the change occurred.
8	<i>Data Length</i>	8	If successful shall be set to 10h else shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	If the command was not successfully completed the PPM shall set this field to 01h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 01h.

If the GET\_CAPABILITY Command completed successfully then the PPM shall return additional Data following the GET\_CAPABILITY Response as described in Table 4-14.

**Table 4-14: GET\_CAPABILITY Data**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>bmAttributes</i>	32	Bitmap encoding of supported PPM features. See Table 4-15 for a description of each bit.
32	<i>bNumConnectors</i>	7	This field indicates the number of Connectors that this PPM supports.  This field shall not be set to zero unless the Device Container is a Billboard Only USB Type-C Bridge.  This field shall be set to zero if the Device Container is a Billboard Only USB Type-C Bridge.
39	<i>Reserved</i>	1	Reserved and shall be set to zero.
40	<i>bmOptionalFeatures</i>	24	No optional features are supported in this version of the specification.  This field shall be set to zero.
64	<i>bNumAltModes</i>	8	This value in this field shall be ignored as the field is not supported in this version of the specification.  This field shall be set to zero.
72	<i>Reserved</i>	8	Reserved and shall be set to zero.
80	<i>bcdBCVersion</i>	16	Battery Charging Specification Release Number in Binary-Coded Decimal (e.g., V1.20 is 120H). This field shall only be valid if the device indicates that it supports BC in the <i>bmAttributes</i> field otherwise the field shall be set to zero.
96	<i>bcdPDVersion</i>	16	USB Power Delivery Specification Revision Number in Binary-Coded Decimal (e.g. 0200h for Revision 2.0, 0300h for Revision 3.0). This field shall only be valid if the device indicates that it supports PD in the <i>bmAttributes</i> field otherwise the field shall be set to zero.
112	<i>bcdUSBTypeCVersion</i>	16	USB Type-C Specification Revision Number in Binary-Coded Decimal (e.g. 0120h for Revision 1.2).

**Table 4-15: bmAttributes Field Description**

Bit	Description
0	Disabled State Support This bit shall be set to one to indicate this platform supports the Disabled State as defined in Section 4.5.2.2.1 in the [USBTYPEPEC].
1	Battery Charging This bit shall be set to one to indicate this platform supports the Battery Charging Specification as per the value reported in the <b>bcdBCVersion</b> field.
2	USB Power Delivery This bit shall be set to one to indicate this platform supports the USB Power Delivery Specification as per the value reported in the <b>bcdPDVersion</b> field.
6:3	Reserved and shall be set to zero.
7	Reserved and shall be set to zero.

Bit	Description														
15:8	<b>bmPowerSource</b> At least one of the following bits 8, 10 and 14 shall be set to indicate which power sources are supported. <table border="1"> <tr> <th>Bit</th><th>Description</th></tr> <tr> <td>8</td><td>AC Supply</td></tr> <tr> <td>9</td><td>Reserved and shall be set to zero.</td></tr> <tr> <td>10</td><td>Other</td></tr> <tr> <td>13:11</td><td>Reserved and shall be set to zero.</td></tr> <tr> <td>14</td><td>Uses VBUS</td></tr> <tr> <td>15</td><td>Charge-through Connector</td></tr> </table>	Bit	Description	8	AC Supply	9	Reserved and shall be set to zero.	10	Other	13:11	Reserved and shall be set to zero.	14	Uses VBUS	15	Charge-through Connector
Bit	Description														
8	AC Supply														
9	Reserved and shall be set to zero.														
10	Other														
13:11	Reserved and shall be set to zero.														
14	Uses VBUS														
15	Charge-through Connector														
31:16	Reserved and shall be set to zero.														

#### 4.2.8 Get Connector Capability

The GET\_CONNECTOR\_CAPABILITY Command is used to get the capabilities of a Connector. The format of the COMMAND Data Structure shall be as detailed in Table 4-16.

**Table 4-16: GET\_CONNECTOR\_CAPABILITY Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to GET_CONNECTOR_CAPABILITY.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Connector Number</i>	7	This field indicates the Connector whose capabilities are to be retrieved. This field shall not be set to zero.
23	<i>Reserved</i>	41	Reserved and shall be set to zero.

On successful completion of the GET\_CONNECTOR\_CAPABILITY Command the PPM shall return a PPM Command Response as described in Table 4-17.

**Table 4-17: GET\_CONNECTOR\_CAPABILITY Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	If an Asynchronous Event occurred on a Connector, then the PPM shall set this field to the Connector Number on which the change occurred.
8	<i>Data Length</i>	8	If successful shall be set to 02h else shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.

Offset (Bits)	Field	Size (Bits)	Description
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	If the PPM Command was not successfully completed the PPM shall set this field to 01h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 01h.

If the GET\_CONNECTOR\_CAPABILITY Command completed successfully then the PPM shall return additional Data following the GET\_CONNECTOR\_CAPABILITY Response as described in Table 4-18.

**Table 4-18: GET\_CONNECTOR\_CAPABILITY Data**

Offset (Bits)	Field	Size (Bits)	Description																		
0	Operation Mode Capability	8	<div>If the Connector supports operation in a particular mode, the PPM shall set the bit to a one else it shall set the bit to a zero.</div> <table><tr><th>Bit</th><th>Meaning</th></tr><tr><td>0</td><td>Supports DFP Only</td></tr><tr><td>1</td><td>Supports UFP Only</td></tr><tr><td>2</td><td>Supports DRP</td></tr><tr><td>3</td><td>Supports Analog Audio Accessory Mode</td></tr><tr><td>4</td><td>Supports Debug Accessory Mode</td></tr><tr><td>5</td><td>Supports USB 2</td></tr><tr><td>6</td><td>Supports USB 3</td></tr><tr><td>7</td><td>Supports Alternate Mode</td></tr></table>	Bit	Meaning	0	Supports DFP Only	1	Supports UFP Only	2	Supports DRP	3	Supports Analog Audio Accessory Mode	4	Supports Debug Accessory Mode	5	Supports USB 2	6	Supports USB 3	7	Supports Alternate Mode

0	Supports DFP Only																				
1	Supports UFP Only																				
2	Supports DRP																				
3	Supports Analog Audio Accessory Mode																				
4	Supports Debug Accessory Mode																				
5	Supports USB 2																				
6	Supports USB 3																				
7	Supports Alternate Mode																				
8	Provider	1	This bit shall be set to one if the Connector is capable of providing power on this Connector (either BC 1.2, USB Type-C Current or PD) otherwise the bit shall be set to zero.																		
9	Consumer	1	This bit shall be set to one if the Connector is capable of consuming power on this Connector (either BC 1.2, USB Type-C Current or PD) otherwise the bit shall be set to zero.																		
10	USB Type-C Current	2	<table><tr><th>Value</th><th>Meaning</th></tr><tr><td>00h</td><td>Advertises USB Default Current</td></tr><tr><td>01h</td><td>Advertises USB Type-C 1.5A Current</td></tr><tr><td>02h</td><td>Advertises USB Type-C 3A Current</td></tr><tr><td>03h</td><td>Reserved</td></tr></table>	Value	Meaning	00h	Advertises USB Default Current	01h	Advertises USB Type-C 1.5A Current	02h	Advertises USB Type-C 3A Current	03h	Reserved								
Value	Meaning																				
00h	Advertises USB Default Current																				
01h	Advertises USB Type-C 1.5A Current																				
02h	Advertises USB Type-C 3A Current																				
03h	Reserved																				
12	Reserved	4	Reserved and shall be set to zero.																		

#### 4.2.9 Get Connector Status

This GET\_CONNECTOR\_STATUS Command shall be used to get the current status of a Connector. The format of the COMMAND Data Structure shall be as detailed in Table 4-19.

**Table 4-19: GET\_CONNECTOR\_STATUS Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to GET_CONNECTOR_STATUS.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Connector Number</i>	7	This field indicates the Connector whose status is being queried. This field shall not be set to zero.
23	<i>Reserved</i>	41	Reserved and shall be set to zero.

On successful completion of the GET\_CONNECTOR\_STATUS Command the PPM shall return a PPM Command Response as described in Table 4-20.

**Table 4-20: GET\_CONNECTOR\_STATUS Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	If an Asynchronous Event occurred on a Connector, then the PPM shall set this field to the Connector Number on which the change occurred.
8	<i>Data Length</i>	8	If successful shall be set to 09h else shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	If the PPM Command was not successfully completed the PPM shall set this field to 01h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 01h.

If the GET\_CONNECTOR\_STATUS Command completed successfully then the PPM shall return additional Data following the GET\_CONNECTOR\_STATUS Response as described in Table 4-21.

**Table 4-21: GET\_CONNECTOR\_STATUS Data**

Offset (Bits)	Field	Size (Bits)	Description

This field shall only be valid if the Connector is operating as a provider otherwise it is Reserved and shall be set to zero.</p> <p>If the PPM has lowered the capabilities but the reason doesn't fall into any of the predefined categories, it can choose to not set any of these bits. Also if the Provider Capabilities change and are no longer limited, the PPM shall clear these bits.</p> <p>See Table 4-23 for description of each bit.</p>																		
70	Reserved	2	Reserved and shall be set to zero.																		

**Table 4-22: Connector Status Change Field Description**

Bit	Description
0	Reserved and shall be set to zero.
1	Reserved and shall be set to zero.
2	<i>Power Operation Mode Change</i> When set the <b>Power Operation Mode</b> field in GET_CONNECTOR_STATUS Data shall indicate the current power operational mode of the Connector.
3	Reserved and shall be set to zero.
4	Reserved and shall be set to zero.
5	Reserved and shall be set to zero.
6	<i>Negotiated Power Level Change</i> When set, the <b>Request Data Object</b> field in GET_CONNECTOR_STATUS Data shall indicate the newly negotiated power level. Note that this bit shall be set by the PPM whenever a Power contract is established or renegotiated.
7	<i>PD Reset Complete</i> This field shall be set when the PPM completes a PD Hard Reset requested by the connector partner.
8	Reserved and shall be set to zero.
9	<i>Battery Charging Status Change</i> This bit will be set when the Battery Charging status changes.
10	Reserved and shall be set to zero.
11	<i>Connector Partner Changed</i> This shall be set when either the <b>Connector Partner Type</b> field or the <b>Connector Partner Flags</b> field changes.
12	<i>Power Direction Changed</i> This shall be set when the PPM completes a Power Role Swap requested by the connector partner or due to the PPM autonomously performing a Power Role Swap. The <b>Power Direction</b> field in the GET_CONNECTOR_STATUS Data shall indicate the new Power Role.
13	Reserved and shall be set to zero.
14	<i>Connect Change</i> When set, the <b>Connection Status</b> field in GET_CONNECTOR_STATUS Data shall indicate whether a device is attached to the Connector. In addition, the <b>Operation Mode</b> field in GET_CONNECTOR_STATUS Data shall indicate the current operational mode of the Connector.
15	<i>Error</i> When set, this field shall indicate that an unknown error has occurred on the Connector.

**Table 4-23: Provider Capabilities Limited Reason Field Description**

Bit	Description
0	<i>Power Budget Lowered</i> When set, indicates that the Power Budget for the PPM has been lowered due to it being unplugged from an External Supply.
1	<i>Reaching Power Budget Limit</i> When set, indicates that the PPM is reaching the Power Budget Limit due to too many attached PD Sinks.
2	Reserved and shall be set to zero.
3	Reserved and shall be set to zero.

#### 4.2.10 Get Error Status

The GET\_ERROR\_STATUS Command shall be used to get details about an error, if one is reported by the PPM. The OSPM may send this PPM Command to get additional details on why a PPM Command failed, which is indicated by the PPM by sending a PPM Command Response with the **Error Indicator** set. The OSPM may also send this PPM Command to get additional details on the error associated with a PPM Asynchronous Notification for an Asynchronous Event (e.g. connector change) with the **Error Indicator** set. In either case, the PPM shall clear the error status only after the OSPM has acknowledged the PPM Command Response or PPM Asynchronous Notification. The format of the COMMAND Data Structure shall be as detailed in Table 4-24.

**Table 4-24: GET\_ERROR\_STATUS Command**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Command</i>	8	This field shall be set to GET_ERROR_STATUS.
8	<i>Data Length</i>	8	Shall be set to 00h.
16	<i>Reserved</i>	48	Reserved and shall be set to zero.

On successful completion of the GET\_ERROR\_STATUS Command the PPM shall return a PPM Command Response as described in Table 4-25.

**Table 4-25: GET\_ERROR\_STATUS Response**

Offset (Bits)	Field	Size (Bits)	Description
0	<i>Reserved</i>	1	Reserved and shall be set to zero.
1	<i>Connector Change Indicator</i>	7	If an Asynchronous Event occurred on a Connector, then the PPM shall set this field to the Connector Number on which the change occurred.
8	<i>Data Length</i>	8	If successful shall be set to GET_ERROR_STATUS_DATA_LENGTH else shall be set to 00h.
16	<i>Reserved</i>	9	Reserved and shall be set to zero.
25	<i>Not Supported Indicator</i>	1	Shall be set to 00h.
26	<i>Cancel Completed Indicator</i>	1	Shall be set to 00h.

Offset (Bits)	Field	Size (Bits)	Description
27	<i>Reset Completed Indicator</i>	1	Shall be set to 00h.
28	<i>Busy Indicator</i>	1	Shall be set to 00h.
29	<i>Acknowledge Command Indicator</i>	1	Shall be set to 00h.
30	<i>Error Indicator</i>	1	If the PPM Command was not successfully completed the PPM shall set this field to 01h.
31	<i>Command Completed Indicator</i>	1	Shall be set to 01h.

If the GET\_ERROR\_STATUS Command completed successfully then the PPM shall return additional Data following the GET\_ERROR\_STATUS Response as described in Table 4-26.

**Table 4-26: GET\_ERROR\_STATUS Data**

Offset (Bits)	Field	Size (Bits)	Description																		
0	Error Information	16	<div>This field indicates the reason(s) for the error reported by the PPM.<table><tr><th>Bit</th><th>Meaning</th></tr><tr><td>0</td><td>Unrecognized PPM Command</td></tr><tr><td>1</td><td>Non-existent Connector Number</td></tr><tr><td>2</td><td>Invalid PPM Command specific parameters</td></tr><tr><td>3</td><td>Incompatible connector partner</td></tr><tr><td>4</td><td>CC communication error</td></tr><tr><td>5</td><td>PPM Command unsuccessful due to dead battery condition</td></tr><tr><td>6</td><td>Contract negotiation failure</td></tr><tr><td>15:7</td><td>Reserved and shall be set to zero.</td></tr></table></div>	Bit	Meaning	0	Unrecognized PPM Command	1	Non-existent Connector Number	2	Invalid PPM Command specific parameters	3	Incompatible connector partner	4	CC communication error	5	PPM Command unsuccessful due to dead battery condition	6	Contract negotiation failure	15:7	Reserved and shall be set to zero.

16	Vendor Defined	N	The contents of this field are vendor specific.																		
16+N	Reserved	112-N	Reserved and shall be set to zero.																		

## 5 Operational Model

There shall only be one USB Type-C Bridge per Device Container. In addition to the default Control endpoint, a USB Type-C Bridge shall support a Notification endpoint. The default Control and Notification endpoints shall be used by a USB Type-C Bridge Class Driver in a PDUSB Host to send and receive PPM, Authentication and Firmware Update Related Requests and Notifications/Responses respectively. The Notification endpoint in the USB Type-C Bridge may be also used to send Billboard Notifications back to a USB Type-C Bridge Class Driver. A USB Type-C Bridge shall not send any notifications or responses that are not defined in this specification. A USB Type-C Bridge shall ignore any received requests or responses that are not defined in this specification.

The USB Type-C Bridge shall respond to USB Type-C Bridge class-specific USB Requests with a request error if it is not in the **Configured** USB State. The USB Type-C Bridge Class Driver shall only have one outstanding USB Type-C Bridge class-specific USB Request for a given USB Type-C Bridge active at any given time. The USB Type-C Bridge having sent a USB Type-C Bridge notification shall not send another notification until the previous notification has been acknowledged.

All requests to or notifications from the USB Type-C Bridge shall reference the Connector Number of a Connector on the Device Container, if a Connector Number is part of that request or notification.

The Connector Number used to address the USB Type-C Connectors that the USB Type-C Bridge Class Driver can communicate with shall be determined by the position of the bits set to one in the *bmConnectorMask* in Table 3-1. For example, bit 1 corresponds to Connector Number 1 and bit 3 corresponds to Connector Number 3 and so on and so forth.

The general operational models that describe the PAM, Billboard, and Firmware Update units are defined in their respective specifications.

### 5.1 USB Operating Speed

All Device Containers that support the USB Type-C Bridge class shall only operate at USB 2.0 unless the Device Container already supports some form of USB functionality.

If the Device Container includes a PDUSB Hub, then the USB Type-C Bridge shall be connected to a USB 2.0 downstream port on the PDUSB Hub. The port shall be marked as an Internal/Non-removable port.

If the Device Container does not include a PDUSB Hub but includes some other form of USB functionality, then that Device Container shall expose the USB Type-C Bridge as a separate function within that Device Container.

### 5.2 USB TYPE-C Bridge and PPM

The PPM shall be capable of operating without any OS interaction. On completion of internal initialization, the PPM shall be in the "PPM Idle (Notifications Disabled)" state. The PPM shall not send any PPM Notifications until the OSPM enables one or more notifications via the Set Notification Enable PPM Command. On successful completion of the Set Notification Enable Command the PPM shall transition to the "PPM Idle (Notifications Enabled)" state.

The only PPM Commands the PPM shall process in the "PPM Idle (Notifications Disabled)" state are the Set Notification Enable Command and the PPM RESET Command.

The USB Type-C Bridge Class Driver shall use the default Control endpoint to send PPM Commands to the USB Type-C Bridge and shall receive the PPM Asynchronous Notifications and PPM Command Responses via the Notification endpoint.

The OSPM shall send at most one PPM Command at a time to the PPM. With the exception of the CANCEL and PPM\_RESET Commands the OSPM shall wait until the PPM completes the current PPM Command before sending the next PPM Command. The PPM shall send a PPM Command Response when it completes the PPM Command if the **Command Completed Notification Enable** is enabled.

A PPM\_RESET Command may be sent by the OSPM at any time. The CANCEL Command shall only be sent by the OSPM when it wants to cancel an outstanding PPM Command that it has not yet received a PPM Command Response for.

The PPM shall send at most one PPM Asynchronous Notification at a time to the OSPM. The PPM shall wait until the OSPM Acknowledges the PPM Asynchronous Notification before sending the next PPM Asynchronous Notification. A PPM shall never set the **Connector Change Indicator** if the change on the Connector occurred as a direct result of a PPM Command sent to that Connector unless the PPM will require more time to process the command.

On reception of a PPM Command (neither CANCEL nor PPM\_RESET), the PPM shall:

1. If the PPM is currently processing a PPM Command complete the PPM Command USB Request with a Request Error and exit.
2. Execute the PPM Command.
3. Set the CCI Data Structure and optionally any Data associated with the PPM Command Response as detailed in the sections for each command.
4. If the **Command Completed Notification Enable** was enabled by the OSPM send, a PPM Command Response to the OSPM.

On reception of a CANCEL command, the PPM shall:

1. If the PPM is not currently processing a PPM Command complete the PPM Cancel USB Request with a Request Error and exit.
2. Cancel the current operation(s) it was performing.
3. Complete the CANCEL Command successfully and update the CCI Data Structure with the **Cancel Completed Indicator** set to one.
4. If the **Command Completed Notification Enable** was enabled by the OSPM, send a PPM Command Response to the OSPM.

On reception of a PPM\_RESET command, the PPM shall:

1. Disable all notifications
2. Transition to the "PPM Idle (Notifications Disabled)" state.
3. Reset itself and set the **Reset Completed Indicator** in the CCI Data Structure.
4. Send a PPM Command Response to the OSPM.

When an Asynchronous Event occurs on one or more of the Connectors, then the PPM shall:

1. Set the CCI Data Structure and optionally any Data associated with the PPM Asynchronous Notification.

2. If the corresponding notification was enabled by the OSPM send a PPM Asynchronous Notification the OSPM.

Once the OSPM is notified of either a PPM Command Response and/or a PPM Asynchronous Notification the OSPM shall:

1. Decode the CCI and any additional Data
2. If this was a PPM Asynchronous Notification, send any other PPM Commands the OSPM needs to get details of the PPM Asynchronous Notification.
3. Acknowledge the PPM Command Response or PPM Asynchronous Notification via the ACK\_PCR\_PAN Command. The only PPM Command Response that is not acknowledge by the OSPM is the PPM Command Response for the ACK\_PCR\_PAN or the PPM\_RESET Command.

The USB Type-C Bridge class-specific USB Request shall be deemed complete when the USB Type-C Bridge receives an ACK\_PCR\_PAN Command for the PPM Notification it sent for the original PPM Command, except as explicitly noted in this specification.

### 5.3 USB TYPE-C Bridge and PAM

The USB Type-C Bridge Class Driver shall only use the default Control endpoint to Send Authentication Requests or Responses. If the Request is a Send Authentication Data Request, then the USB Type-C Bridge shall notify System Software of the completion of the same by sending back an Authentication Notification with the **bParam3** field set to either Success or Error. On reception of an Authentication Request/Response from a PD Product attached to a Connector on a Device Container, the USB Type-C Bridge shall send an Authentication Notification and the USB Type-C Bridge Class Driver shall retrieve the Authentication Request/Response by using the Get Authentication Data Request.

All Authentication related requests are deemed complete when the USB Type-C Bridge sends a USB Type-C Bridge Authentication Notification for that command.

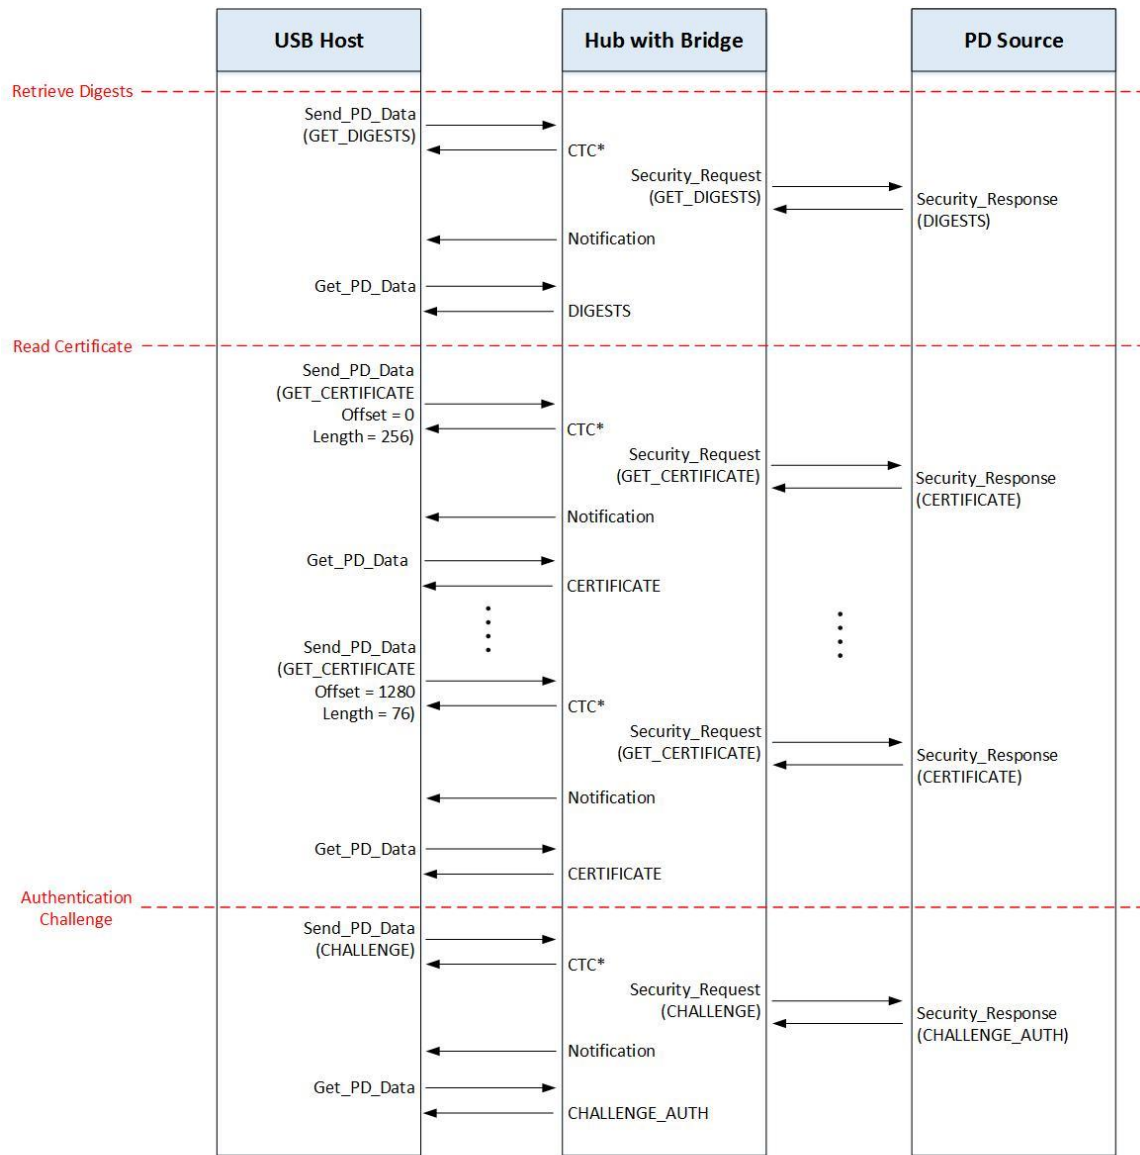

The USB Type-C Bridge Authentication Notifications are acknowledged implicitly by successfully transferring the Authentication Notification to the USB Host over the USB Notification endpoint.

### 5.3.1 Host-Initiated Authentication

To initiate Authentication of a PD Product attached to a Connector on the Device Container, a USB Host Sends an Authentication Request in the **Data** field of a Send Authentication Data Request. The USB Type-C Bridge sends and receives Authentication Messages to/from a PD Product attached to a Connector on the Device Container as described in [USBPD].

When the USB Type-C Bridge receives an Authentication Response from the PD Product, it notifies the Host using an Authentication Notification. Upon receiving the Authentication Notification, a Host uses a Get Authentication Data Request to retrieve the Authentication Message from the Bridge. Figure 5-1 shows an example of a Host-initiated Authentication Sequence when a Connector on the Device Container is attached to a PD Source.

**Figure 5-1 Example Authentication Sequence Initiated by the USB Host**

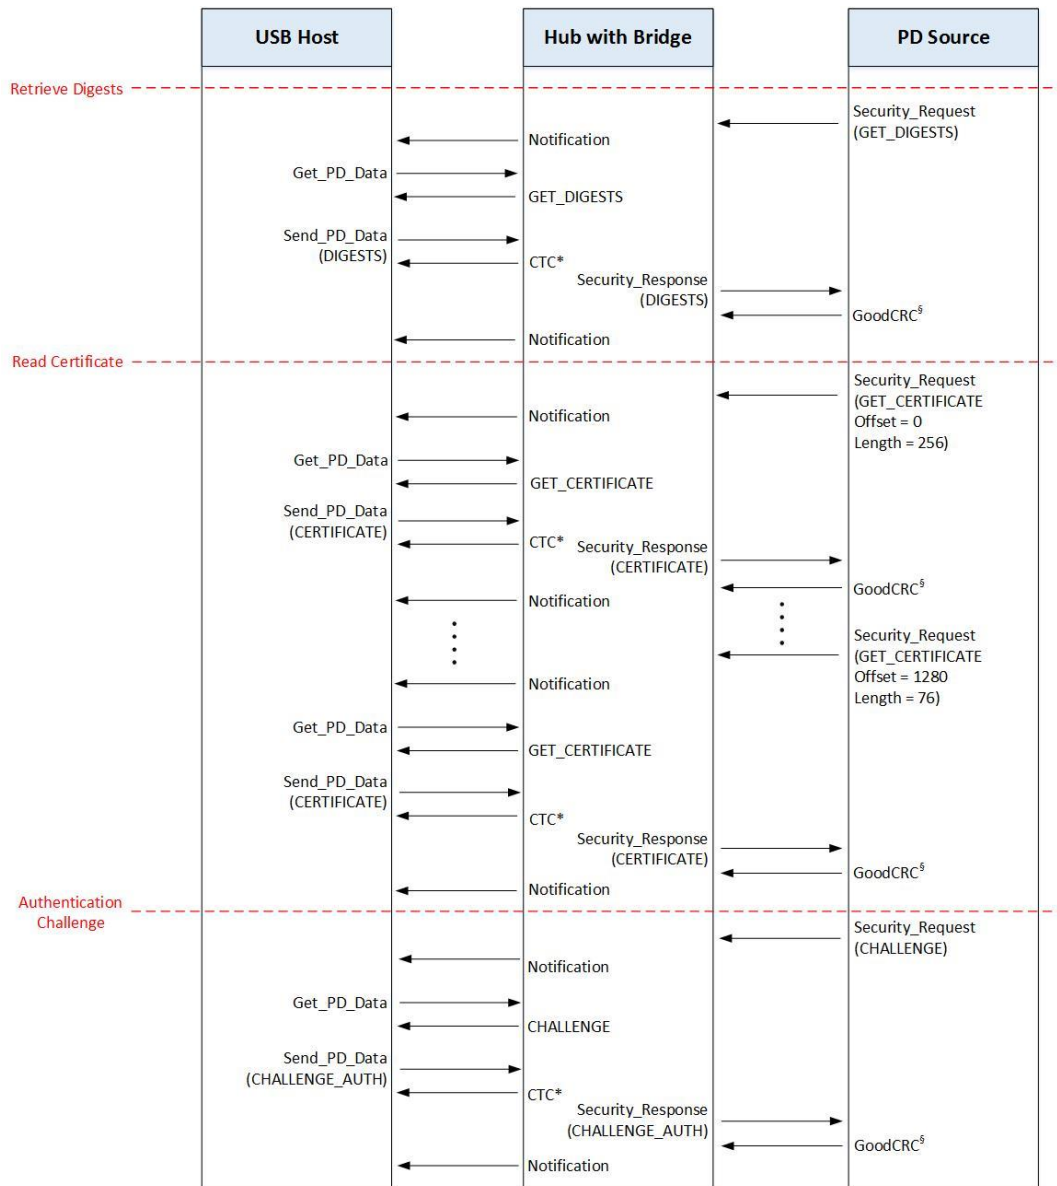

\* CTC = Control Transfer Complete with no error

### 5.3.2 PD Product-Initiated Authentication

Upon receiving an Authentication Request from a PD Product attached to a Connector on a Device Container, a USB Type-C Bridge notifies a USB Host by sending an Authentication Notification. Upon receiving the Authentication Notification, a Host uses a Get Authentication Data Request to retrieve the Authentication Request from the Bridge.

When the Bridge receives a Send Authentication Data Request from the Host, it extracts the Authentication Message from the **Data** field of the received Send Authentication Data Request and sends it to the PD Product as described in [USBPD]. Figure 5-2 shows an example of a Host-initiated Authentication Sequence.

**Figure 5-2 Example Authentication Sequence Initiated by a PD Product**

\* CTC = Control Transfer Complete with no error

§ See [USBPD] for GoodCRC message

#### 5.4 USB TYPE-C Bridge and PFUM

The USB Type-C Bridge Class Driver uses the default Control endpoint to Send Firmware Update Requests. The USB Type-C Bridge will notify the USB Type-C Bridge Class Driver of the completion of the same by sending back a Firmware Update Notification with the **bParam3** field set to either Success or Error. On reception of a Firmware Update Response from a PD Product attached to a Connector on the Device Container, the USB Type-C Bridge shall send a Firmware Update Notification containing the response data.

All Firmware Update related requests are deemed completed when the USB Type-C Bridge sends a USB Type-C Bridge Firmware Update Notification for that command.

The USB Type-C Bridge Firmware Update Notifications are acknowledged implicitly by successfully transferring the Firmware Update Notification to the System over the USB Notification endpoint.

##### 5.4.1 Host-Initiated Firmware Update

To initiate Firmware Update of a PD Product attached to a Connector on a Device Container, a USB Host Sends a Firmware Update Request in the **Data** field of a Send Firmware Update Data Request.

#### 5.5 USB TYPE-C Bridge and Billboard

When a USB Type-C Bridge supports the Billboard functionality, the Billboard Capability shall be as defined in [USBBB]. The USB Type-C Bridge shall use the mechanisms defined in [USBBB] to notify System Software of a change in its Billboard Capability descriptor. If a USB Type-C Bridge supports the Billboard functionality it shall also support the Billboard Notification. Using the Billboard Notification method allows the USB Type-C Bridge to avoid unnecessary USB Disconnect/Connect whenever there is a change in the Billboard Capability descriptor.

On Power up or after a USB Reset the USB Type-C Bridge shall not send any Billboard Notifications and it shall use the mechanisms defined in [USBBB] to notify System Software of any Billboard Capability changes.

If the USB Type-C Bridge supports the Billboard functionality (See Table 3-1) and System Software Enables the Billboard Notification via the Enable/Disable Billboard Notification Request, then the USB Type-C Bridge shall transition to notifying System Software of changes in its Billboard Capability descriptor via the Notification endpoint. The USB Type-C Bridge Class Driver shall use the standard Get BOS Descriptor Request, to retrieve the Billboard Capability descriptor, when the USB Type-C Bridge sends a Billboard Notification to the System Software.

The USB Type-C Bridge Billboard Notifications are acknowledged implicitly by successfully transferring the Billboard Notification to the System over the USB Notification endpoint.

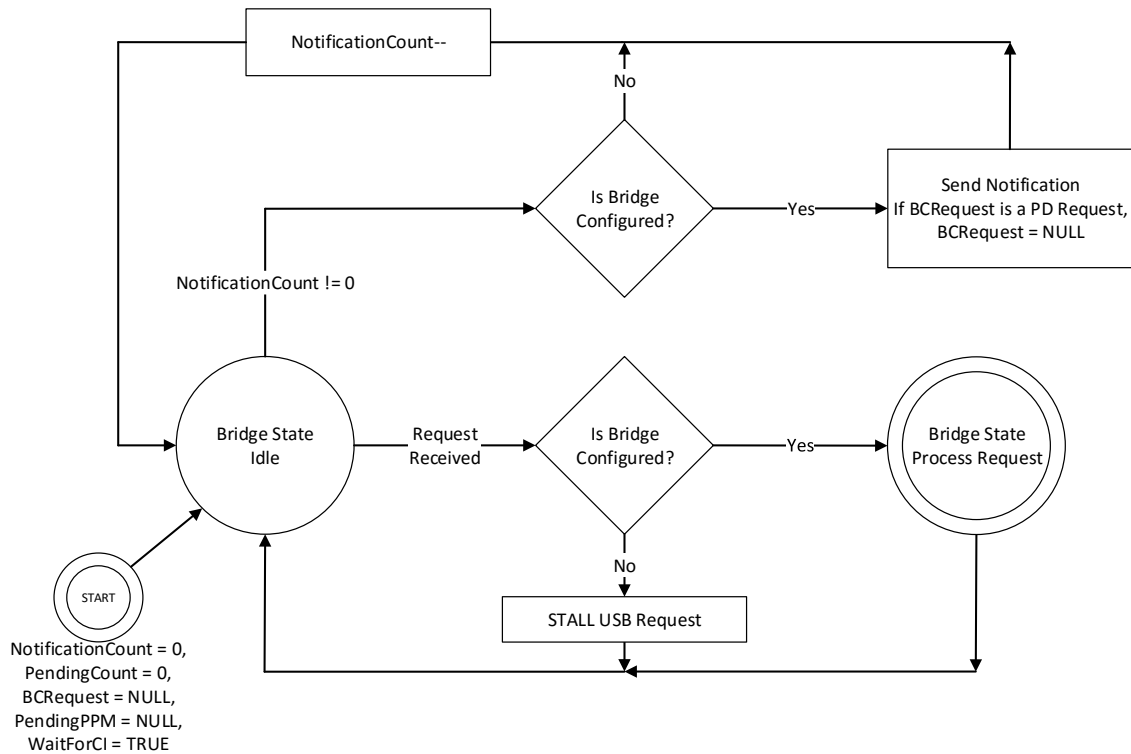

#### 5.6 USB TYPE-C Bridge Initialization

The USB Type-C Bridge shall enumerate and initialize as a standard USB 2.0 Device. During Type-C Bridge initialization, System Software should scan all the Connectors on the Device Container.

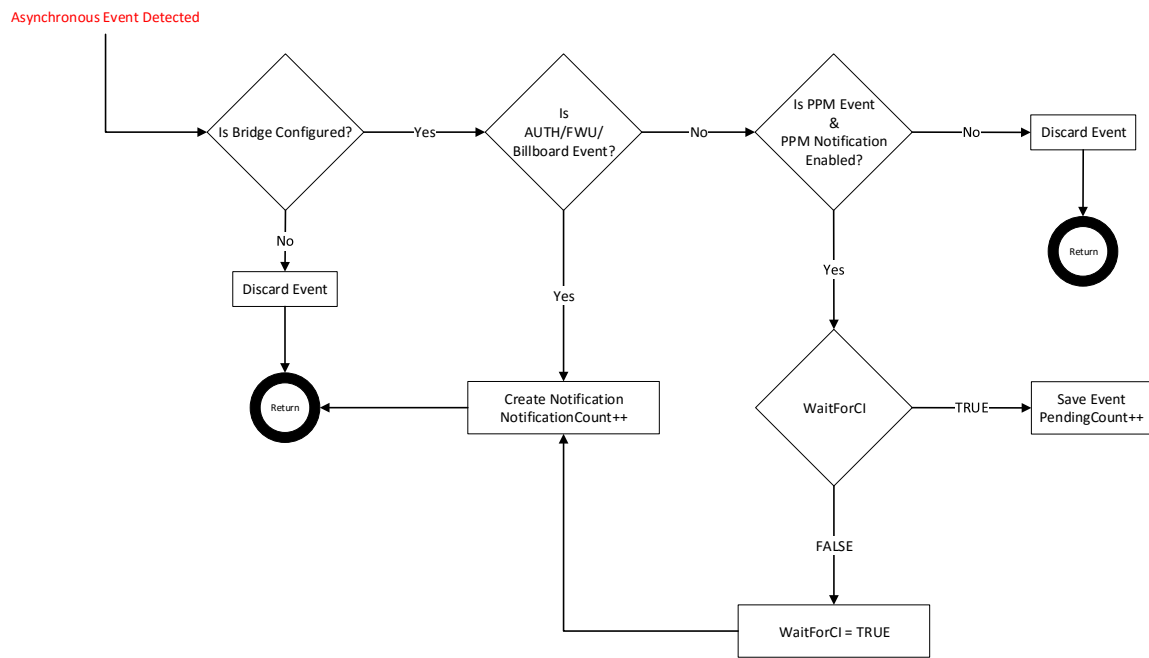

## 5.7 USB TYPE-C Bridge Operational State Diagram

The figures in this section describe the operational state diagram for a USB Type-C Bridge.

**Figure 5-3 Request/Notification Processing**

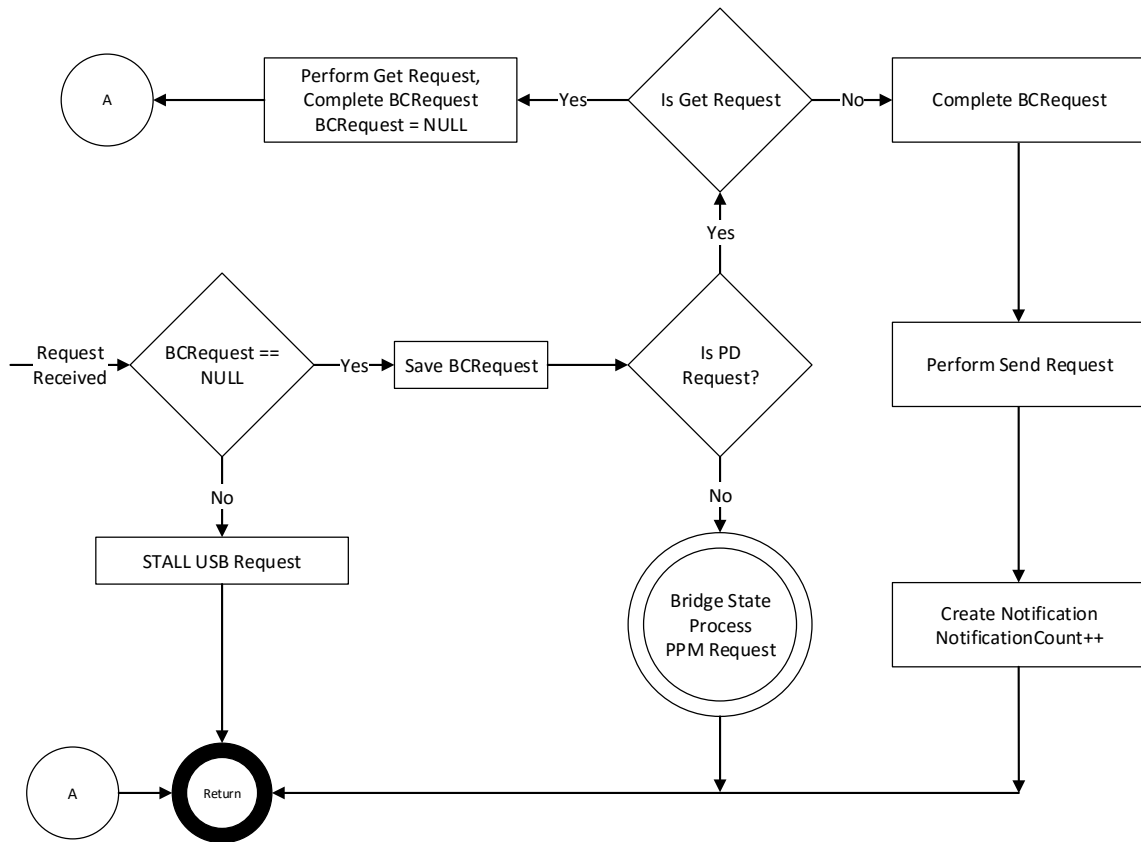

**Figure 5-4 Asynchronous Event Handling**

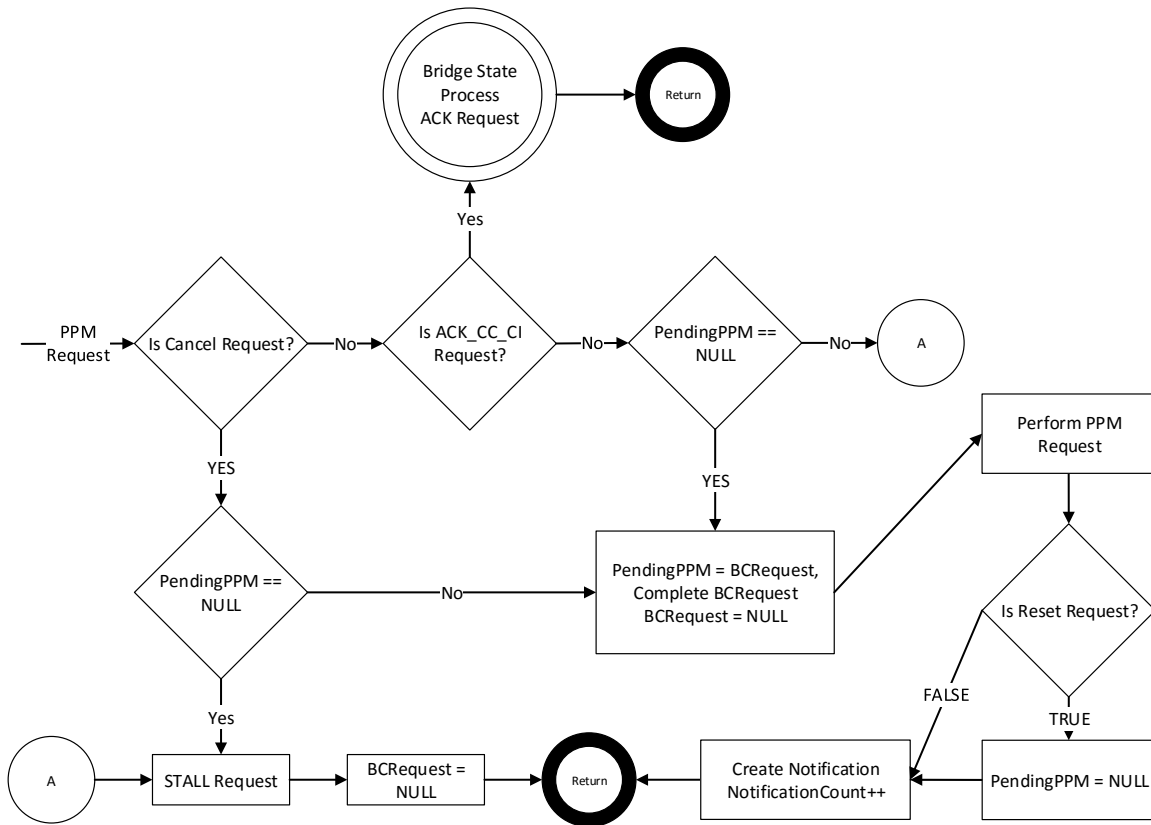

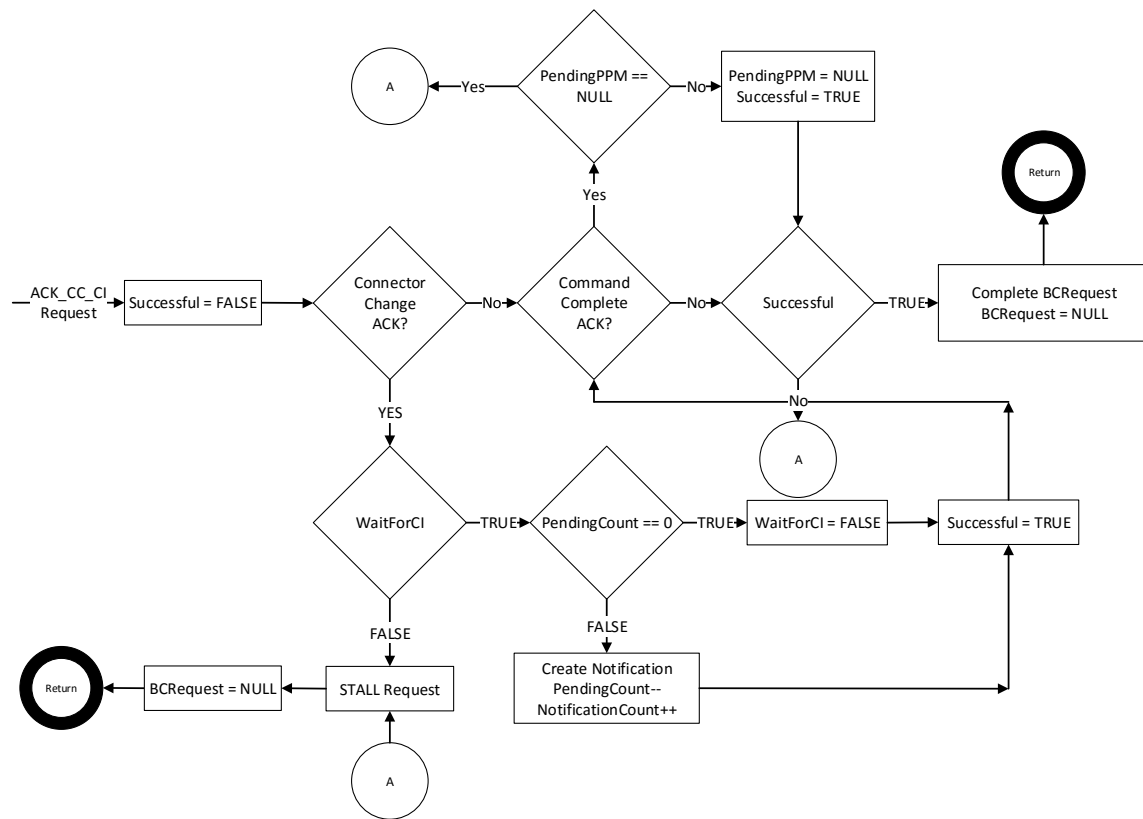

**Figure 5-5 Process Request**

**Figure 5-6 Process PPM Request**

**Figure 5-7 Process ACK Request**

## 5.8 USB Type-C Bridge Suspend/Resume

This section details how System Software may suspend a Device Container with a USB Type-C Bridge and the expected behavior of System Software when it wants to Resume the Device Container or it receives Resume signaling from the Device Container.

### 5.8.1 USB Type-C Bridge Suspend

The USB Type-C Bridge shall support Remote Wake. When enabled for Remote Wake, the USB Type-C Bridge shall attempt to wake the System up whenever it detects an Asynchronous Event that would have caused it to send a notification.

System Software shall enable the appropriate notifications (e.g. OSPM is expected to enable Connect Change Notification on the USB Type-C Bridge) such that an Asynchronous Event is translated into a Resume Signal. Only PPM Notifications can cause a Remote Wake event to be generated by the USB Type-C Bridge. The steps to properly enable Remote Wake shall be the following:

1. System Software enables the appropriate PPM Asynchronous Notifications.
2. System Software enables Remote Wake on the USB Type-C Bridge.
3. System Software suspends the port on which the USB Type-C Bridge is connected.
4. If the Device Container contains a PDUSB Hub
  - a. System Software enables Remote Wake on the PDUSB Hub.

- b. System Software suspends the PDUSB Hub.

#### **5.8.2 USB Type-C Bridge Resumed by Host**

If the Device Container is resumed by Host-Initiated Wake, then System Software shall scan all the Connectors on the Device Container for current connector status and capabilities. The steps to properly resume after Host-Initiated Wake shall be the following:

1. System Software drives Resume signaling on Device Container upstream port.
2. If the Device Container contains a PDUSB Hub
  - a. System Software resumes the port on which the USB Type-C Bridge is connected.
3. System Software scans all the Connectors on the Device Container.

#### **5.8.3 USB Type-C Bridge Resumed by USB Type-C Bridge**

If the Device Container initiates the Wake, then once resumed, the USB Type-C Bridge shall send the PPM Notification that caused the USB Type-C Bridge to resume the System. The steps to properly resume after Device-Initiated Wake shall be the following:

1. USB Type-C Bridge initiates resume signaling.
2. System Software acknowledges resume signaling and clears the port suspend on the downstream port on which the Device Container is connected.
3. If the Device Container contains a PDUSB Hub
  - a. System Software resumes the downstream port on which the USB Type-C Bridge is attached.
4. USB Type-C Bridge sends the PPM Notification to System Software.
5. System Software scans all the Connectors on the Device Container.

## A Values of Constants

### A.1. Class Codes

**Table A-1: Class Codes**

Code	Value
Class	12h
Subclass	00h
Protocol	00h

### A.2. Request Types

**Table A-2: Request Types**

Request	Value
SEND_PPM_COMMAND	01h
SEND_PD_DATA	02h
GET_PD_DATA	03h
ENABLE_BB_NOTIFICATION	04h

### A.3. Notification Types

**Table A-3: Notification Types**

Notification	Value
PPM_NOTIFICATION	01h
PD_NOTIFICATION	02h
BILLBOARD_NOTIFICATION	03h
Reserved	04h - FFh

### A.4. Constants

**Table A-4: Constants**

Parameter	Value
MAX_UCB_PPM_DATA_LENGTH	38h
MAX_DATA_LENGTH	MAX_UCB_PPM_DATA_LENGTH
GET_ERROR_STATUS_DATA_LENGTH	10h
AUTH	01h
FWU	02h
BRIDGE_CAPABILITY	21h
