1. Introduction

1.1 Background

The USB 2.0 compliance program allowed the certification of bus powered hubs. The USB 3.2 compliance program has not allowed certification of bus powered hubs because of power limitations.

1.2 Objective

This document establishes definitions and guidelines that allow expansion of the Bus Powered Hub certification program to include USB 2.0 and USB 3.2 hubs that receive at least 3A of USB Type-C Current on the Upstream Facing Port.

1.3 Scope of the Document

This document is for the developers of hubs that can be powered from sinking $V_{BUS}$ on its upstream facing port and/or from some other source. The original definitions of bus-powered and self-powered mapped those power characteristics directly to specific bus/self-powered fields in the Configuration and Capability Descriptors defined in the USB 2.0 and USB 3.2 specifications [USB 2.0, USB 3.2]. This description is no longer sufficient for defining compliance testing for hubs using USB Type-C and USB Power Delivery.

This document should be used in combination with other compliance documents applicable to the Devices USB product type. To determine which other compliance documents are applicable please use the test matrixes linked in Section 1.5 Related Documents.

Table 1-1 Summary of power type combinations addressed in this document
1.4 UFP Powered Definitions

The term ‘UFP Powered’ is used to describe any peripheral that is capable of sinking power from \( V_{BUS} \) on its upstream port. A bus-powered peripheral is a specific subset of a UFP Powered peripheral.

A peripheral is considered a ‘UFP Powered Device’ if it has the capability of sinking UFP Power. Similarly, a peripheral is considered an ‘Externally Powered Device’ if it has the capability of sinking power from any source other than the UFP. A peripheral can be both a UFP Powered Device and an Externally Powered Device.

2. Configuration, Functional and Power Guidelines

2.1 Configuration and Capability Descriptors

A UFP Powered Port will set its Configuration and Capability descriptors based on the below table [USB 2.0, USB3.2, USB Type-C, USB PD].

Table 2-1 clarifies which hubs are described as UFP Powered

<table>
<thead>
<tr>
<th>UFP Power</th>
<th>Configuration Descriptor bmAttributes D6</th>
<th>Configuration Descriptor bMaxPower</th>
<th>USB PD Capability Descriptor bmAttributes</th>
<th>USB PD Consumer Port Capability Descriptor bmCapabiliites</th>
<th>USB PD Consumer Port Capability Descriptor dwMaxOperatingPower</th>
</tr>
</thead>
<tbody>
<tr>
<td>Legacy Connectors</td>
<td>0 or 1</td>
<td>USB 2.0 0 &lt; x ≤ 500mA</td>
<td>descriptor not present</td>
<td>descriptor not present</td>
<td>descriptor not present</td>
</tr>
<tr>
<td>USB Type-C Default</td>
<td>0 or 1</td>
<td>USB 2.0 0 &lt; x ≤ 500mA</td>
<td>bit 14 set to 1</td>
<td>bit 2 set to 0</td>
<td>500 mA – max 2.5 W</td>
</tr>
<tr>
<td></td>
<td>USB 3.2 0 &lt; x ≤ 900mA</td>
<td></td>
<td>bit 6 set to 0</td>
<td>bit 2 set to 0</td>
<td>900 mA – max 4.5 W</td>
</tr>
<tr>
<td>USB Type-C (1.5A or 3.0A)</td>
<td>1</td>
<td>0</td>
<td>bit 6 set to 1</td>
<td>bit 2 set to 1</td>
<td>1.5 A – max 7.5 W</td>
</tr>
<tr>
<td></td>
<td></td>

<td>bit 14 set to 1</td>
<td>bit 1 set to 1</td>
<td>3.0 A – max 15 W</td>
</tr>
<tr>
<td>USB PD</td>
<td>1</td>
<td>0</td>
<td>bit 2 set to 1</td>
<td>bit 1 set to 1</td>
<td>max 100 W</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>bit 4 set to 1</td>
<td>bit 0 set to 1</td>
<td>max 7.5 W</td>
</tr>
</tbody>
</table>

These descriptors are based on current guidance; however, they are in the process of being updated by USB working groups and will likely be changed in the coming months.
2.2 UFP Powered Hub Configuration

The following describes the configuration guidelines of a UFP Powered Hub.
- A UFP Powered Hub may only sink power from one USB Type-C data capable port at a time (i.e. a UFP Powered Hub may sink power from the UFP or one of its DFPs).
- If operating from UFP Power, a DFP may disable its Battery Charging 1.2 capability.
- Power drawn by the product (including indicator lights) should be reported in the PD descriptors.
- A UFP Powered Hub’s power draw may not exceed the power contract negotiated with the source regardless of what occurs on the DFPs.

2.3 Hub Upstream Facing Port

The following is defined for UFP Powered Hubs Upstream Facing Ports:
- A UFP Powered Hub should have one UFP that is properly labeled, and its role is clearly communicated to the end user [USB Type-C].
- The UFP of a USB 3.2 UFP Powered Hub must be a USB Type-C port.

This document assumes that the UFP on a UFP Powered Hub is acting as a power sink.

2.4 Hub Downstream Facing Ports

The following is defined for UFP Powered Hubs Downstream Facing Ports:
- A UFP Powered Hub must provide multiple exposed DFPs.
- The USB Type-A and USB Type-C DFPs will be implemented as independent groups, any load change on a USB Type-A port should not result in a voltage change on any of the USB Type-C ports and vice-versa [USB Type-C].
- It is encouraged that each DFP have its own power limiting and overcurrent protection.

Additional non-USB ports and other functionality will add additional power requirements.

2.4.1 USB Type-C DFPs

The following is defined for any USB Type-C DFPs:
- USB Type-C DFPs should support at least USB 3.2 Single-Lane Power as a source [USB Type-C].
- All USB Type-C DFPs should support the same functionality or shall be clearly marked as to the functionality supported [USB Type-C].
- A UFP Powered Hub’s USB Type-C DFPs may not have Dual-Role-Data (DRD) capabilities.
- A UFP Powered Hub’s USB Type-C DFPs may have Dual-Role-Power (DRP) capabilities.  
  Note – This includes Sinking Host ports. [USB Type-C]
- A UFP Powered Hub with multiple USB Type-C DFPs will act as an Assured Capacity USB Type-C Multi-Port Charger [USB Type-C].  
  Note – This will be reviewed and updated upon the availability of the “USB-IF USB Type-C Shared Capacity charging program”. 

Note – This includes Sinking Host ports.
2.4.2 USB Type-A DFPs
The following is defined for any USB Type-A DFPs:
- USB Type-A DFPs should support at least USB 2.0 High Power as a source [USB 2.0].
- USB Type-A DFPs that are USB 3.2 capable may disable USB 3.2 SuperSpeed functionality and drop down to USB 2.0 speeds and power when there is insufficient power received by the UFP. [USB 3.2, USB 2.0].

2.5 Power Sinking Device (PSD) Port
This document currently does not cover the use case of a Power Sinking Device port on a UFP Powered Hub. Until guidelines are solidified, Power Sinking Device ports are not encouraged.

2.6 Compound Device
A UFP Powered Hub may be implemented as a Compound Device, in which case it should meet all testing conditions for a UFP Powered Hub, except that a Compound Device’s DFPs are not required to be exposed and may be internal to the device.

2.7 USB Billboard Device
A UFP Powered Hub should present a Billboard Device in any situation in which the source does not provide enough power for the hub to provide full functionality [USB BB]. If insufficient power to present a Billboard Device is provided to the hub (less than 4.5W), the hub should not enumerate.

3. Testing Procedures
3.1 General Testing Requirements
A UFP Powered Hub will be tested against all applicable tests in the “USB 3.2 Product Test Matrix” [USB 3.2 Matrix] and the “USB Type-C Product Matrix” [USB Type-C Matrix].

If the product is to be shipped with a USB charger/cable, the charger/cable must be certified.

3.1.1 Externally and UFP Powered Hubs
A hub capable of sinking power from both the UFP and External Power will be tested with its External Power connected and disconnected as defined in the “USB Interoperability Test Procedures” specification [USB Interop].

3.1.2 UFP Powered Hubs (No External Power Capability)
A UFP Powered Hub with no external power capabilities should provide some hub functionality if drawing more than or equal to 15W from its UFP. Hub functionality is defined as the ability to provide power and data capabilities to two or more DFPs (USB or Non-USB).
Note – Presenting a USB Billboard Device is not defined as providing some hub functionality in this context.

3.2 Hub Depth Tests

The following provides a brief description of the depth testing conditions for a UFP Powered Hub. A full description of test steps will be provided in the *Bus-Powered Hub Interoperability Test Steps* in the “USB Interoperability Test Procedures” specification [USB Interop]:

- Test fully populated DFPs at 1 hub depth. All DFPs will be populated with peripherals of different transfer types.
- Follow standard interoperability hub testing procedure, using Externally Powered Hubs for hubs not under test.
- UFP Powered Hubs that do not support External Power do not need to be tested against the *Self-Powered Hub Interoperability Test Steps* described in the “USB Interoperability Test Procedures” specification [USB Interop].

3.3 Upstream Port Partner Testing Conditions

UFP Powered Hubs will be tested using the following sources connected to the hubs UFP:

- USB Type-C Host operating as a 15W source.
  - Expected to provide some hub functionality if no external power capabilities.
  - Expected to provide USB Billboard Device if full functionality not provided.
- USB Type-C Host operating as a 4.5W source.
  - Expected to provide USB Billboard Device if full functionality not provided.
- USB Type-C Host that can source the required power for the hub to operate at full functionality (Only tested if the UFP Powered Hub does not provide full functionality when connected to a USB Type-C Host operating as a 15W source).

4. Example Implementations

The following tables provide several examples for potential UFP Powered Hubs, they are for reference only and are only four of many possible UFP Powered Hub implementations eligible for certification. They are meant to provide a base for what the power consumption and management may look like in USB 3.2 UFP Powered Hubs.

These hub examples include some ‘non-USB ports’, the port current and power associated with these ports are for reference only. Non-USB ports may have Interoperability requirements defined in the “USB Interoperability Test Procedures” specification [USB Interop].

The examples below factor in the minimum source voltage of 4.75V and maximum USB Type-C cable drop of 750mV. Therefore, as shown below a UFP Powered Hub should be designed to operate while only receiving 12W of power on its UFP.
### Table 4-1 Example UFP Powered Hub – 1 USB Type-C Source, 1 USB Type-A Source, 1 Non-USB

<table>
<thead>
<tr>
<th>Source Power</th>

</tbody>
</table>

1. Assumed 14.25W (4.75V/3A) of UFP Power as only power source (no External Power).
2. 3W of power available to the hub circuitry.
5. Summary of Guidelines

The following section summarizes the conditions that will be considered in the USB-IF certifying a UFP Powered Hub in addition to the testing the product undergoes.

5.1 UFP Powered Hub Checklist

1. Set Configuration Descriptors correctly based on the UFP Power provided?
2. Set Capability Descriptors set correctly based on the UFP Power provided?
3. Does the UFP Powered Hub expose 1 clearly identifiable USB Type-C UFP?
4. Does the UFP Powered Hub expose 2 USB DFPs (may be internal for Compound Device)?
5. Are the USB Type-C and USB Type-A DFPs implemented as independent groups?
6. Do all exposed USB Type-A DFPs provide a minimum of USB 2.0 High Power?
7. Do all exposed USB Type-C DFPs provide a minimum of USB 3.2 Single-Lane Power?
8. Do all USB Type-C DFPs act as Assured Capacity Chargers with the same capabilities?
9. Does the UFP Powered Hub provide some hub functionality at 15W of UFP Power?
10. If UFP Powered Hub cannot provide full functionality at the received UFP Power does it present a billboard device indicating insufficient power?
