Summary
This documentation defines new usages to support HID sensor devices that can buffer sensor data and deliver it to the host when the buffer becomes full.

Background
Primary mechanism that a host uses to get data from HID sensor devices is by specifying a report interval value. This is the elapsed time period for periodic input report generation. Instead of delivering input reports immediately to the host the device can instead buffer input reports and deliver it in batches. That is, we want to decouple the rate at which a device collects data and the rate at which it delivers it to the host. This can result in significant power savings in the processor, especially in the case of continuous sensing applications that must run when the processor goes to sleep. Instead of waking the processor for every single input report, data can be buffered and processed as a whole batch.

This change proposes usages for supporting such devices. We want to propose a usage for exposing a static value that the device will use to expose the maximum number of events that can be batched for a particular sensor. There is no guarantee that the device can always batch this many number of input reports, especially if the batch is being shared by multiple sensors in a HID device. Batching is done only on a best effort basis. We also want to propose a usage that the device can use to get a latency value from the host. This value indicates (along with the report interval) indicates the amount of input reports that the device should batch.

Proposal
We want add the following two new usages to the Sensors Usage Page.

<table>
<thead>
<tr>
<th>Usage ID</th>
<th>Usage Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x031A</td>
<td>Property: Maximum FIFO Events</td>
</tr>
<tr>
<td>0x031B</td>
<td>Property: Report Latency</td>
</tr>
</tbody>
</table>

Remove the following from section 1.0, page 12:
- Omit 0x031A and 0x031B from Property: Reserved

Add the following to section 1.5, page 29

<table>
<thead>
<tr>
<th>Maximum FIFO Events</th>
<th>SV – Indicates the maximum number of input reports that can be stored in a buffer by this sensor. The actual size can be smaller than this value since the FIFO can be shared by multiple sensors.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report Latency</td>
<td>DV – Specifies the maximum latency that the host can tolerate before receiving a batch of input reports. The device should use this value (along with the report interval) to calculate the number of input reports it should batch before delivering it to the host. When the buffer becomes full, the device will deliver input reports to the host in the order in which the reports were buffered. That is, the oldest input report will be delivered first.</td>
</tr>
</tbody>
</table>
